ONTARIO Mining Regulations.

The following summary of the principal
provisions of the General Mining Act of
the Province of Ontario is published for
the information of those interested in
mining matters in the Algoma District,
and that part of the Nipissing District
north of the Mattawan River, Lake Nipis-
sing and French River.

Any person or persons may explore for
mines or minerals on any Crown Lands
surveyed or unsurveyed, not marked or
staked out or occupied.

The price of all lands sold as mining
locations or as lots in surveyed townships
is two dollars per acre cash, the pine timber
being reserved to the Crown. Patentees
or those claiming under them may cut and
use such trees as may be necessary for
building, fencing or fuel, or for any other
purpose essential to the working of mines.

Mining locations in unsurveyed territory
shall be rectangular in shape, and the
bearings of the outlines thereof shall be due
north and south, and due east and west
astronomically, and such locations shall be
one of the following dimensions, viz: eighty
chains in length by forty chains in width,
containing 320 acres, or forty chains square,
containing 160 acres, or forty chains in
length by twenty chains in width, con-
taining 80 acres.

All such locations must be surveyed by
a Provincial Land Surveyor, and be con-
nected with some known point or boundary
at the cost of the applicant, who must file
with application surveyor's plan, field notes
and description of location applied for.

In all patents for mining locations a
reservation of five per cent. of the acreage
is made for roads.

Lands patented under the Mining Act
are free from all royalties or duties in re-
spect to any ores or minerals thereon, and
no reservation or exception of any mineral
is made in the patents.

Lands situated south of the Mattawan
River, Lake Nipissing and French River
are sold under the Mining Act at one
dollar per acre cash.

Affidavits showing no adverse occupa-
tion, improvement or claim should ac-
company applications to purchase.

T. B. PARDEE,

Commissioner
Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or
to work Minerals on any of
their Mining Lands and
Mineral Reservations,

Covering nearly a

Quarter of a Million Acres

In Eastern Ontario, and principally
within the belts containing
Iron, Phosphate, Gold, Galena
Plumbago, Mica, Marbles,
Building Stone,
and other valuable Minerals.

A Narrow Escape.—Hugh McKeever, a quarryman at Verplanck's, N. Y., celebrated Harrison's election by exploding dynamite cartridges at a safe distance from his house. When it began to rain hard he entered his house, still having one of the dynamite cartridges in his possession. He touched the fuse to the fire in his pipe and attempted to throw the cartridge out of the door. It struck against the woodwork and fell back in the room. McKeever ran into an adjoining room, where his two children, Hugh, aged thirteen, and Lizzie, aged eleven, were in bed. He threw himself on the bed and covered his head with the bed clothing. When the cartridge exploded it tore out the front and rear of the house, demolished the doors and windows and badly wrecked the furniture. The bed on which were McKeever and his two children, was blown through the side of the house, but none of them were seriously hurt. The house was completely wrecked.

Vancouver Coal Mining and Land Company.—Commenting upon the agreement recently made by this company and the Messrs. Rosenfeld the *Financial News* says: "Hope deferred seems to have made the hearts of the directors of the Vancouver Coal Mining and Land Company sick, for they are apparently anxious to give up the business just as the horizon is brightening. They have had to struggle for several years against adverse circumstances, which have made dividends scarce, none having been paid since December, 1880. Last year there was a serious explosion in the company's mines which did not improve matters. As a result the debit balance of the company reached the sum of £20,985. The operations of the half year ending with June have been sufficiently profitable to wipe out this accumulated deficit all but £127. It must be noted that, in spite of the troubles which have beset the company, it has never failed to pay interest on its debentures and to make ample allowance for depreciation, so that whenever the corner should be turned there should be no burden to be cleared off save the simple deficit. It is necessary to remember this when considering the conditional arrangements now made by the directors for selling the property. Were the company embarrassed beyond recovery it would be easy to understand the motives which inspire the board, but in the light of the report presented to the shareholders upon December 4 the proposal of the directors is a little mysterious."

Endless Rope Haulage.—Mr. Thomas Henry Bailey read a most interesting paper on the subject of endless rope haulage before a recent meeting of the of South Wales, Institute of Engineers at Cardiff. In the course of this he showed that the importance of efficient haulage to the mining industry of the present day could scarcely be over-estimated, as the coal easily reached near the surface had been exhausted in most of the large coal fields of the country, and at the greater depths now necessary colliery owners were compelled to adopt various systems of underground haulage. The two most important features with reference to efficient haulage were the gradient and the friction of the conveyance carrying the load. The particular method under description was that known as the "endless rope" system, which had been laid down in the South Duffryn Colliery at the Plymouth Works, Merthyr Tydfil. A packing of sand behind a brickwork lining of the archway was found to be a sure means of preventing local pressure from the surrounding strata. The whole of the underground engines and pumps required were worked by compressed air. In the Plymouth colliery the rope was carried under the trams or tubs, and the other disadvantage of the system was that to apply it economically two lines of railway were required, and consequently very wide roads were needed to accommodate the large trams used in South Wales. The hauling engines in use shewed a total indicated power of 18-horse power exerted on the cranks. At the time there were fifteen full trams and fifteen empty trams attached to the rope about forty yards apart, and the engines were making twenty revolutions per minute. The rope was travelling about one mile and one-third per hour. Several members followed in discussion, and agreed that the system was excellent if it was cheap. Mr. Bailey promised to give particulars as to cost at the next meeting, and the discussion was adjourned.

A Serious Error

IN COOKING FOR THE SICK LIES IN THE METHOD OF PREPARING BEEF TEA

which deprives it of all its nutrition. It is customary to STRAIN the BOILED LIQUOR and deprive it of SCUM and RESIDUE.

PLEASE NOTE—That the SCUM is the ALBUMEN, the RESIDUE is the FIBRINE, and the CLEAR LIQUOR that is left has no

more nutritive power THAN A CUP OF COFFEE. The application of heat coagulates the albumen, which is the most important constituent of meat, and is insoluble in boiling water.

JOHNSTON'S FLUID BEEF

By its Patent Process of Manufacture RETAINS ALL THE ALBUMEN, the FIBRINE and the PHOSPHATES. In fact it contains all the valuable ingredients THAT EXIST IN THE MEAT ITSELF.

Victor Electric Fuses.

Superior to all others for Exploding any make of Dynamite, High Explosives, or Gelatine Powder. Each Fuse is tested and warranted extra strong and waterproof. Low grades of Dynamite Powder will do ten per cent. more execution if detonated with Victor Electric Fuses.

VICTOR BLASTING MACHINES.

Latest improvements, made in three sizes, easy to operate, strong and durable. No expensive repairs, low in price, will fire any make of Electric Fuses.

MANUFACTURED ONLY BY

JAMES MACBETH & CO.,

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Apply to

ALEXANDER CAMPBELL,
Annapolis Royal, N.S.

12th, 1888.

A New Ore Roaster.—An ore roasting furnace has been patented by Albert C. Johnson, of Wilmington, Del. It is for desulphurising copper ores, iron pyrites, gold bearing sulphurets and other ores, and is provided with different compartments in which are placed raking bars of novel construction, the ore to be gradually moved from one compartment to the other, and agitated in each compartment by the raking teeth or fingers, which also impart an outward or inward motion to the ore.

Electric Motors for Underground Haulage.—In a paper read the other day at a meeting of mining engineers, in South Wales, Mr. J. Fox Tallis dealt with the application of electricity to underground haulage, and came to the conclusion that the electric motor was the best means for underground hauling. The author, however, did not consider that locomotive motors were practicable. This view is quite opposed to that held by Mr. A. W. Sheaffer, who in June last read a paper on the same subject to the Engineers' Club of Philadelphia. In it he pointed out that nine locomotives are very objectionable on account of the danger to good ventilation caused by the noxious gases thrown off during the combustion of their fuel. In consequence of this they can only be used in the gangways carrying the return current. He points out that the electric locomotive avoid this, as well as other objections, and states that the Lykens Valley Coal Company, at their mines in Dauphin County, have introduced the electric locomotives with considerable success. The comparison between the cost of mule, steam, and electric haulage is given as follows:—Cost per ton per mile 1-82-100 cents, and 4-10 to 67-100 cents, respectively. An electric railway has also been established since January, 1884, in the Neu-Stassfurt Saltworks, and has been decidedly successful. The plant was made by Messrs. Siemens and Halske, of Berlin and Vienna.

Mines and Mineral Resources of India.—Out of 105 collieries there were 69 at work during the years 1886-7. They employed 24,794 hands, as compared with 22,745 in the previous year, and the total output of coal rose from 1,294,221 tons to 1,388,487 tons. The total imports of coal from Europe and Australia during the year were 765,668 tons. The largest proportional increase took place at the Assam and Umeria coal fields. The Nizam's Railway has now reached the Singareni coal fields, in the Kistna valley, so that before long that coal will displace imported coal on the Hyderabad Railway and on the Madras railway system. Arrangements are being made for using coal from the Dandot mine on a part of the Punjab railway system, and investigations are being made into the three known coal-bearing areas of Upper Burmah. The Chindwin coal is already used to some extent on river steamers. Coal from the Assam mines is said to have come into the Calcutta market, and to fetch as much as 14 rupees per ton. Iron is worked to a limited extent, after native methods, in all provinces and in many districts. The Barrakur Iron Works, which have, within a radius of five miles excellent coal, iron, and lime, did not pay during the year, the stock of pig iron rose from 677 tons to 3,683 tons and there were few buyers. Everywhere English iron is in common use, and generally undersells the local product.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

The Salt Beds of South America.

The salt beds on the west coast of South America, according to the description of Dr. Carl Oehsenius, occur in a narrow strip along the coast line of the rainless district, rarely exceeding 25 miles in width. The district is bounded on the north by the Andes, and extends into the coast Cordilleras on the south. The author considers that, before the upheaval of the Andes, salt began to deposit in certain bays, which had been wholly or partially shut off from the sea by the gradual formation of an intercepting bar. Then, while the process of evaporation was yet incomplete, the district was raised by volcanic action, and the mother liquors from the salt lakes eventually escaped, running down into the valleys, and where they encountered no obstacle, reaching the sea. The coast of Cordilleras acted as a barrier in the southern portion of the district, while in the northern part the liquors doubtless returned to the sea. The volcanos which produced the upheaval exhaled immense quantities of carbonic acid gas, by the action of which a portion of the sodium chloride in the mother liquors was converted into sodium carbonate. The coast in this part of Chili is studded with small islands containing deposits of guano rich in ammonia. The guano dust is carried by the prevailing west winds far into the country, where, on exposure to the air at a warm temperature, it would gradually oxidise to nitrate, and, acting on the sodium carbonate, would form sodium nitrate, or Chili saltpetre.

Asbestos in California.—One of the largest and most valuable deposits of asbestos in the world has recently been discovered in the Mojave country, not far from the line of the proposed Carson and Colorado railway between Keeler and Mojave. The mineral sources of this region have hitherto been considered worthless, except for the deposits of borax, soda and salt. The asbestos recently discovered near Oro Grande is as fine as has been found anywhere in the world, whilst the amount of mineral in the vein far exceeds that found in any other locality. The vein is about 25 ft. in thickness, and has been proved to extend for a distance of 1,500 ft., and is traceable for nearly three-quarters of a mile by croppings that occasionally come to the surface. Unlike many other asbestos deposits, this vein is almost unmixed with hornblende and tremolite. The fibres are long, silky and of a beautiful pearly lustre. The fibres are tough as flax, and are capable of being spun into a fine thread. Besides the fine fibrous asbestos which occupies the centre of the vein, there are on the outside great bodies of what is termed "rock cork," a variety of asbestos which is as easily cut and quite as light as ordinary cork, readily floating on water; also "rock wood" and "rock beaters," both of which are very similar to rock cork. In the same vein there appears to be an inexhaustible quantity of ordinary asbestos, such as is used for covering steam pipes, &c. The true amianthus is found in veins from 1 ft. to 4 ft. in thickness, and can be pulled out with the naked hand in tufts upwards of 3 ft. in length. Tale is also found in the same neighbourhood in immense quantities, and might be used for making firebricks and melting-pots mixed with asbestos, and no doubt when the Mojave country is opened up for the construction of the proposed Salt Lake City and Los Angeles Railway, the mineral resources of this hitherto unknown region will be fully developed.—*Society of Arts Journal.*

OCCURRING MINERALS.

In preparation—A SYNOPSIS OF MINING GEOLOGY.

American Institute of Mining Engineers.

We take this opportunity of acknowledging with our best thanks, the courtesy of Mr. R. W. Raymond, Secretary of the American Institute of Mining Engineers, in sending us the advance sheets of the papers read before the October meeting of the Institute at Buffalo. We hope soon to be able to reproduce some of these valuable contributions to mining literature in our pages.

The Canadian Mining Review

UNION CHAMBERS, 14 Metcalfe St.

OTTAWA.

Vol. VIII. JANUARY, 1889. No. 1.

Provincial Mining Laws.

The present system, which permits the acquisition and control of large acreages of land upon payment of a merely nominal price, is undoubtedly a most favourable arrangement for capitalists and speculators, but is one that is in every way opposed to the interests of the people at large and to the development of our mining industries. Now, vast districts are locked up in a few hands, and no one desiring to operate upon them is permitted to do so unless he can afford to purchase the land at an immense advance upon its cost. In the financial centres there are numbers of men who have developed a passion for mining ventures and who are always ready to risk money in developing and working mines, but who will not lock up funds in the purchase of lands upon which they have to make the expensive outlay for so risky a venture as mining, or, as it has been aptly though somewhat profanely termed, "gambling with God." Everyone who has tried to influence capitalists to embark in mining ventures knows how easy it is to raise working capital alone compared with obtaining money for a scheme weighed down with a preliminary purchase of lands often at ten times the sum required for actual operations. In our phosphate districts cases have occurred where lands originally purchased from the Government for two or three dollars an acre have been resold at \$10, \$100 and as high as \$400 per acre. One tract bought for \$5,000 was resold at \$16,000, then at \$160,000, and part of it again for \$450,000. The sums required to pay interest on such large capitalization tend greatly to discourage investment, and the usual failure of mining enterprises loaded up with such a weight of dead outlay is the most serious check upon the development of mining industries.

If capitalists were permitted to lease upon royalty just as much land as they could work and only for such periods as they continued to work, or if the poor prospector could lease the acre on which he has found a valuable deposit and be at no expense beyond the cost of working, sharing his results with the people to whom the soil and its contents by natural right belong, then we should see a vast increase of mining operations, the revenue derived from royalties would be a constant and important source of income, and the people would cease to barter away their natural rights for a paltry "mess of pottage." It is pleasing to note that the Provincial Government of Quebec has decided to revise its Mining Act during the coming Session, while it is not at all improbable that the Report

of the Mining Commission will bring about many beneficial changes in the laws governing the disposal of mineral lands in Ontario.

A New Zealand Gold Mining Concern.

A company is now being formed in London, England, under the name of the "Island Block Gold Mining Co., Limited," for the purpose of mining on the Moa Flat Estate, on the Clutha, or Molyneux River, Otago, New Zealand, known as the Island Block.

The land over which the property extends is four miles in length, varying from 600 to 2,000 feet, and has an area of 800 acres.

From borings obtained by practical mining engineers at different parts of the bed of the river, gold was found in all the test holes yielding an average of about 13 grains to the ton. These holes varied from 22 to 42 feet in depth.

The formation consists of mica schists which has been denuded and carried down from the mountains forming the banks of the river.

The company is about to erect "Hydraulic Elevators" for the working of these deposits. They propose utilizing water, piped about 2½ miles in a direct line from the property, from an elevation of 600 feet or more.

It is claimed that "by the use of these elevators, four men can lift to a height of 60 feet, and sluice 1440 tons of wash dirt, sand and gravel, in eight hours, at a cost of less than one penny per ton, and that without steam or any complicated machinery, a force equal to 700 HP (continuous all the year round) is easily and cheaply obtained."

From the altitude of the supply of water, there can be no question as to the power obtained, as it exerts about 260 lbs pressure to the square inch.

But the quantity of material treated, viz.: 1440 tons, by four men in eight hours, is simply "prodigious," as it means 180 tons per hour, or 3 tons per minute.

Admitting that under the great pressure of water (which can be obtained) that the wash dirt, sand and gravel can be displaced, how, (in addition to this) this quantity is lifted to the height of 60 feet, and sluiced, so as to save the gold, by so small a force of men, is a matter that should be investigated in the interest of cheap and economic gold mining.

Then the question arises, how do they arrange their sluice so as to treat so great a quantity in the time above stated, and ensure successful amalgamation? For if the gold be "fine" and "flakey" (such as we have to contend with in western countries) it would be difficult to do this, as the quantity and velocity of the water necessary to properly sluice three tons of wash dirt, sand, gravel, etc., per minute would destroy the proper density, and would not admit of the "fine" and "flakey" gold being caught by the amalgam on the plates, or by the quicksilver in the traps, and it is well known by experience that "fine" and "flake" gold readily floats on

water, and if the water in the sluices be too dense and too heavily charged with the slimes, this difficulty is increased. It is also found that if the current be too swift in the sluice, loss of gold will follow.

Therefore, in view of these facts, it would be a matter of interest and instruction to know how this company treats successfully three tons per minute of low grade material carrying only 13 grains to the ton.

In conclusion, from statistics given, they claim that the cost for mining, elevating, amalgamating, management, quicksilver and other charges can be done for 6 cents per ton. If their practical work verifies this, it will reflect the greatest credit on the executive officers in charge.

English Fertilizer Trade.

The rise in phosphate prices is no doubt somewhat owing to the increased demand for fertilizers in England. The farmers appear to be more prosperous than they have been for some years past, and have been better able to pay for manures. The consequence is that all the manufacturers have been able to dispose of their products more fully than for several years.

This trade has been very much overdone in the past, and competition has reduced prices below a profitable point. The increased demand is inducing an effort among manufacturers to combine for higher prices, and if they succeed in this the producers of phosphate may come in for a share of the benefit. A private letter lately received from London says: "There is a very decided movement in England among the manure manufacturers to get better prices, and not before they need, for I am certain there has been a serious loss incurred by all in the trade, without any exception, all from over production and fighting against each other for what trade there has been. A very large meeting was held at the Cannon Street Hotel, and I hear there are some hopes of an understanding, but I don't think there is any chance of success as long as any makers will supply the Farmers' Associations. The fact is, an enterprising man turns up who may have been unfortunate in business; he sets to work and induces maybe a thousand farmers to subscribe one guinea each, which forms his salary. He then gets supplies from one or other of the manufacturers at the very lowest possible prices, and then not only supplies farmers at the cost, within a shilling or two, per ton, but advertises the members' prices in the various agricultural papers, thus at once spoiling the chance of all remunerative prices. He gets cash from all the well-to-do men, and leaves the needy at uncompensating prices for the other dealers and makers."

Our Canadian miners, who sometimes think they are victimized in their sales to English manufacturers, will see that the buyers in turn undergo commercial torture, and that the lesson of the day is conference, conciliation and combination among the workers of each department of industry and trade, in order that the strife of

commerce shall no longer be between individuals but between organized hosts. If users of fertilizers and the manufacturers are each associating to act in unison, it behoves producers of the raw material to likewise combine their forces and harmonize their efforts, and banish forever the suicidal individual strife and opposition among themselves which has too much governed the disposal of their products in the past; for if they have thus been an easy prey to the organized buyers, how can they withstand the united action of an associated industry? Let Canadian miners learn this lesson of the age speedily, and work intelligently and harmoniously together for the advancement of their common interests.

The Mineral Resources of the United States, 1887.

The annual report on "The Mineral Resources of the United States" for 1887 has just been issued by the Geological Survey at Washington, and comprises among the large amount of information contained therein, valuable remarks on and statistics of the production of numerous minerals and their products in Canada as well as in the United States. Under the head of copper, in which speculation has run riot of late, allusion is made to the Canadian Copper Company at Sudbury, Ont., which has developed "down to 300 feet, the existence of a large body of nickel copper ore." The smelting works there, erected by Dr. Edward D. Peters, are also referred to. A number of very valuable letters on the general copper industry are given. Manganese from Nova Scotia comes in for quite a share of notice, a table being given shewing the production of that ore in Nova Scotia from 1861 to 1887 inclusive. The report states that no returns have been obtained from New Brunswick. This seems to us a pity, as the Washington authorities give due prominence in this report to Canadian minerals which bear effect on trade with the United States.

Coal is mentioned as an import from British Columbia into California, and the amount produced in the former Province as well as in Nova Scotia is given in a table shewing the world's production of coal, but nothing is said of the amount of Nova Scotia coal used in the Eastern States, which is rather a curious omission.

The petroleum trade of Canada is dwelt upon at some length, statistics of production in and shipments from Canada being given. Some very interesting details accompany the remarks, both as regards capital invested, the extent of the works of some of the oil companies, and their capacity, and the tinworks connected therewith. These in one company alone own a plant which cost \$10,000 for manufacturing cans, mostly five-gallon capacity, and which being put up two in a case, are intended for transportation to the North-West, to British Columbia, and to the Maritime Provinces. The report winds up by saying, "there are no reliable statistics of production in Canada," and the figures given

are "the estimates of parties intimately connected with the industry."

The article on natural gas, by Mr. Joseph D. Weeks, contains much research, and is of great interest in connection with the excitement prevalent everywhere in connection with the search for this natural fuel, the use of which, for manufacturing purposes, has already in the United States been the means of saving a great consumption of coal, equal in 1887 to nearly ten million tons. Mr. Obalski's report on natural gas in Quebec has been condensed, and the most salient points of it are quoted *verbatim*. His report is spoken of as "a very thorough study of the conditions under which natural gas has been found."

Nova Scotia and New Brunswick both appear to contribute grindstones to the United States, but no figures are given to shew the amount of that trade. Apatite, as Canadian phosphate is termed in the report, is only referred to as shewing the quantity produced from 1878, and is apparently not yet in any great demand in the United States, the Canadian deposits affording most of the article used in their superphosphate works at present.

Gypsum, both in the crude state and as alabaster and spar ornaments, contributes a fair trade with the United States from Ontario, Nova Scotia and New Brunswick, Ontario contributing the smallest and Nova Scotia the greatest quantity. The production of graphite in Nova Scotia in 1887 was 300 tons, and it is stated that the production will doubtless be increased owing to "the interest of Americans in Canadian mines. It is practically all exported to the United States." A valuable report on Mineral Waters, by Mr. A. C. Peale, will be found very useful by those who seek information under that head, but none of the Canadian springs are mentioned. It appears from this article that the consumption of mineral water from springs is largely on the increase, whilst that of artificial waters is correspondingly diminishing.

The whole report is a most useful work of reference for any library, or for persons largely interested in mining matters. We are glad to see our own Geological Survey quoted as an authority, and the work originated on a similar basis to this United States report, although yet in its infancy, can be made to prove as valuable ultimately to Canadians, as the report now reviewed is to Americans generally. In conclusion we wish to remark that if all our own Government reports were as fully indexed as the volume before us, their value would be very much enhanced.

Canadian Phosphates in England.

Just as we go to press we are in receipt of a special cable from London stating that "Canadian phosphate deposits are receiving much attention among the agricultural classes, here in view of the threatened exhaustion of the Guano beds of Peru and Chili. The *Times* and *Morning Post* are drawing special attention to Ottawa County phosphates, declaring that the phosphate industry is only in its infancy in Canada, and urging British capitalists to provide for their further development.

LETTERS TO THE EDITOR.

We invite Correspondence upon matters consistent with the character of the REVIEW.

Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Rand Drill Test.

NEW YORK, January 9th, 1889.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—In your issue of December, we observe a letter addressed by our aggressive friends the Rand Drill Company, in which, under the heading "Comparative Drill Test," they present a table giving the results in detail of a power drill test at the Ludington Mine.

In the first place, permit us to say in answer to your comments, that we will assume that the test was thoroughly made, that the air supply was accurately measured, and that the figures given in the table are true; but we must protest against the inference which might be drawn, and which your correspondent evidently intends that your readers should draw from his figures. By an analysis of the table, we are brought for results to the last column, in which the consumption of air per inch of hole drilled is given for the "Rand" and the "Sergeant" drills respectively, under two conditions, one where the drills are mounted on columns, and the other on tripods. Now, our aggressive friends evidently desire that your readers should see very clearly that in both of these tests the "Rand" drill was bigger than the "Sergeant," and that the unthinking reader should hold up his hands in amazement that so many claims have been made for the "Sergeant," when a big "Rand" drill consumes less air per inch of hole drilled than a little "Sergeant." Is it fair to make a comparative test of the consumption of air per inch of hole drilled, between two drills, one of which has a larger diameter, hence a greater area of pressure; and a heavier piston, hence a greater momentum and force of blow than the other? On the contrary, can anyone dispute the claim that when boring hard granite boulders, a strong blow is required in order to make progress, and does anyone question the fact that a big machine will hit a harder blow than a little one? Can we not easily imagine a small drill pegging away at a hard granite boulder and consuming several hundred cubic feet of free air per minute without progressing a single inch, while a large drill of precisely the same construction would make considerable progress with an equal consumption of air. The comparison may be illustrated by a man and a boy at work driving railroad spikes. The boy may accomplish less, but will expend more breath per spike than the man.

It seems to us that the figures prove two things very clearly. In the first place, that a big drill will consume less air than a little one per inch of hole of same diameter drilled, when operating in hard material (a fact well understood heretofore). And in the second place, that a "Rand" drill takes more than twice as much air per inch drilled, when working horizontally than when working vertically or downward (due to the cushioned blow—a dis-

tinctive defect in the "Little Giant"), while with the "Sergeant" the proportion is very much more uniform. These facts furthermore prove that a test on the consumption of air per inch of hole drilled between drills of different sizes, has no practical value.

INGERSOLL ROCK DRILL CO.,
W. L. S.

The Utility of Waste Sawdust.

Owing to private reasons "Engineer" declines to answer Mr. F. D. Taylor's letter in our last issue asking for information as to where and how waste fuel is utilized in the United States.—EDITOR.

Steam Pump Practice.

NEW GLASGOW, N.S., 21st Dec., 1889.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—In your November issue there appears an article under this heading, reproduced from the *American Machinist*. Such articles are no doubt interesting to your readers, but the one in question, while advancing some thoroughly practical ideas, is somewhat in error regarding the use of the so-called air chamber, which is described as a practical remedy for the evil arising from a suction pipe becoming obstructed or being too small or too long. There seems to be an erroneous idea prevalent, even among practical men, regarding the chamber now largely in use on the suction pipes of pumps. It is commonly mentioned as an *air chamber*, and the fact of it being called such, and its action described in the article in question "as an elastic cushion of air for the incoming water to come into contact with so as not to strike the returning plunger with so hard a blow," tends to confirm rather than dispel the erroneous idea.

The chamber must, correctly speaking, be a vacuum chamber, because, having a direct communication with the suction pipe, whatever be the degree of vacuum required to allow the atmospheric pressure to force the water to the pump affects all parts alike in communication with the suction pipe, and if a vacuum gauge be placed on the chamber it will be found to register the varying degrees of vacuum as the vertical lift is increased; so then the usefulness of the chamber on the suction pipe cannot be as described in this article, but exactly the reverse. It may be described as follows: Let us suppose the lift to be such as requires a vacuum of 10 lbs. to be formed before the water will rise to the pump; then 10 lbs. of the atmospheric pressure must be removed from the pump barrel, the suction pipe and the chamber on the suction pipe, and water in rising up the suction, with a velocity due to the speed of the plunger, passes the chamber and rushes into the pump barrel, where the vacuum is being formed and maintained. Then at every turn of the stroke of the plunger the formation of vacuum ceases, and the water continues its upward flow in the suction pipe to the vacuum chamber until the plunger commences its return stroke or until it destroys the vacuum which first caused it to be put in motion. The so-called "air chamber" on the suction pipe tends to keep the column of water in that pipe in motion while the plunger is turning or changing its stroke, as the air chamber *proper* on the discharge tends to keep that column of water in motion; but the action of each is as opposite as the lifting and forcing of the pump on which they are used, the pres-

sure of the air in the chamber on the discharge being in proportion to the column forced, and the vacuum in the chamber on the suction being in proportion to the weight of the column raised.

I am, &c.,
BRITON.

In General.

A piece of bad type in our last issue made the total exports of Canadian Phosphate for 1888 read 17,416 tons instead of 17,446.

Mr. James Nicholas, a well known chemist from London, is travelling in the country for the purpose of examining mining properties with a view to purchases for an English Syndicate.

Du Lievre.

One of our correspondents writes: The late mild weather has been a source of trouble to the regularity of the mining operations of our river, once more showing the desirableness of more practicable roads and means of communication between the mines and the C. P. R. line. The sudden closing of the navigation on the 21st November took the managers by surprise; the winter provisions at the mines, and the grinding stock at the mills, were somewhat incomplete in consequence. Nature's river road, which promised so well at the start, began to fail at Christmas, and on resuming work after the holidays three teams together loaded with provisions, broke through the ice at Priests' Creek, thereby destroying the road at this place. Smith's Point too has been another place where a "portage" was necessary, so that it has been impossible so far, to commence the transport of the supply of "seconds" for the mills at the Basin, and "*habitants*" and their teams are looking hungry for lack of work and provisions. We anxiously look for good ice to promote the normal activity of our river.

We learn that Messrs. Lomer, Rohr & Co. have made arrangements to utilize the grist mill at the Basin for the grinding of the second grade phosphate of that district. It is well known that the pulverization of phosphates in Europe is universally effected by horizontal French burrs, but some are inclined to suppose that our Canadian apatites are too hard to be treated in a like manner. We take exception to this opinion, remembering that several varieties of mineral phosphates, such as come from Aruba, W. I., and the Department of Lot, France, are equally hard as our average "green ore." We therefore congratulate Messrs. Lomer, Rohr & Co. in leading the way to demonstrate that good old-fashioned machinery can often hold its own against the patented complications burdened with heavy royalties, which so often give cause for regret when costly "experiments" are performed in the laboratory of industrial enterprises.

We observe that some of the "grinders" now applied to this important and ever increasing industry, give much annoyance from frequent breakages, whereby projected profits quickly transform themselves into heavy losses and disappointment to shareholders.

The Dominion Company is now erecting very complete wharves and loading facilities at their new North Star landing, where admirable arrangements are being made for the storing of ore, and their easy transport to scows by a system of car tracks from each bin. This improvement speaks well for the intelligent direction of this prosperous enterprise. We also understand that the directors are now considering the advisability of putting their own steamboat on the river to tow their scows this coming season.

The Phosphate of Lime Co. (limited) is still enjoying the benefit of its "bonanza" chamber in their old stand-by the No. eleven pit at High Rock, and the work goes on merrily. The enormous quantities of cordwood being now piled up and drawn in from the remote points of their limit, gives cause for reflection that our timber supplies will evidently play out long before our phosphate deposits. Are we to see King Coal supreme and coming to our aid, or will it be our natural water powers, captive and obedient to our will, which shall keep in movement our restless drills and derricks?

The Canadian Phosphate Co. (limited) is benefitting by the mild winter in continuing to run their Beaver-meadow car track without intermission, so that the only difficulty has been to obtain sufficient hands in order to avoid a block by too much material in the cobbing house. The present new company having completed the first year of its existence, held its general meeting in London (Eng.) this month. Several important improvements will have been discussed and disposed of at this opportunity, of which we hope to furnish the report in our next issue.

The works for the construction of the new locks at the Little Rapids have completely blocked the portage road at this point. The mining companies above the Rapids, and all interested in the winter transport on the river, have just cause to demand that an efficient portage should be immediately provided, otherwise the passage of heavy teams will be quite impracticable.

We have received from Messrs. Stewart & Spittall, Ottawa, a very favorable report by an experienced Geologist on their phosphate locations on lots 1, 2, 3, 4, 5 and 6, in the 4th range of Bowman, and lot 6 in the 10th range of Portland West, in all about 700 acres.

Perth District.

Mr. Peter McLaren has commenced work on his phosphate property on lot 4 at Otty Lake; this property was worked a few years ago and several thousand tons were taken from surface shows; preparations are now being made for deep mining on a large scale, and so far the indications of favorable results are very satisfactory. Mr. McLaren has also purchased a new phosphate property in Bedford, near Fermoy. This location was discovered about six weeks ago by T. R. Taggart, of Westport, and has good prospects of becoming one of the best productive properties in Ontario. One of the veins shows phosphate 30 feet wide on the surface. Operations on both these lots are now being pushed forward under the able superintendence of Mr. E. Watts, of Buckingham, a miner of considerable experience, in the working of phosphate locations.

The Anglo Canadian Phosphate Company are having improving results at the Otty Lake mines, some wide and persistent seams having been discovered that promise steady work for the winter. At the Bobb's Lake mines the success is regarded as phenomenal; one of the oldest Canadian phosphate miners, now at work there, states that in the region of a mile's extent there is not a space for twenty feet without a seam of phosphate, and an experienced mining engineer, who has just surveyed the property, reports that he examined 67 different veins of phosphate which had been opened since June last and out of which 99 piles of phosphate had been taken, amounting to over 700 tons, done by a force averaging less than 15 men all told. He says "he never saw anything like it;" states that in one pit the men are sinking on a seam of 5 feet wide of solid phosphate, while in a drift from the same pit they are in a bed of phosphate measuring 18 feet by 8 feet and its extent not yet known; there is not a great deal of impurity to separate and the phosphate is being placed on the pile ready for shipment at a cost of not over \$2 a ton.

Kingston District.

Mr. Jas. Foxton and Messrs. Smith and Lacy are putting out ore, and Mr. Foxton's mine is said to be looking remarkably well. Some enterprising Americans are tunnelling a hill on one of Capt. Moore's properties in Sydenham, with a view to the profitable working of phosphate veins that have been discovered higher up the hill. Capt. Moore expects to have about 400 tons from his properties by spring.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

L. E. McKam, accompanied by a Mr. Leslie, of Philadelphia, is at Springville looking over the iron properties for a syndicate of American capitalists. Mr. Leslie, who is an expert, speaks highly of the ore and thinks there is unlimited quantities of it.

The output from the Intercolonial Coal Company's mines, Westville, for the past year to 30th November, reached 152,400 tons. The sales by land and water to same date were 138,000 tons.

We learn that the New Albion Mine at Montague, known as the DeWolf gold mining property, has been sold to a New York syndicate, by Charles Annand, for the handsome price of \$60,000 in cash.

We understand the "Westfield" gold mine in Queen's County, has been purchased at a fair sum by Capt. Nicholls, for some of his English friends. It appears the property was bonded several months ago, and considerable prospecting done since on the "Jumbo" lode, which ranges from 20 to over 75 feet wide. A shaft has been sunk some 40 feet deep in one of its widest places, and the yield far exceeds anticipations. Free gold is prominent, but its chief value lies in the concentrates which are abundant. No doubt this pioneer mine on such large leads will cause much stir in the locality, and also call attention to some of the other large leads of the province.—*Critic.*

Over three quarters of a million tons of coal were shipped from Cape Breton mines last year, and the output was only limited by the ability to secure vessels to carry coal to the upper provinces.

The annual general meeting of the shareholders of the Cumberland Railway and Coal Company will be held at the Company's offices, Chesterfield Chambers, St. Alexis Street, Montreal, on Wednesday, 13th February next, at 3 30 in the afternoon. The transfer books will be closed from the second day of February, exclusive, until after the meeting.

The Coxheath copper mine, owned by the Eastern Development Company (Limited), is quietly but vigorously pushing development work with a force of 100 men. Compressors, drills and boilers to increase the Rand power drilling plant to ten drills, left New York December 28th., and will reach Sydney about January 9th. A winter's supply of dynamite has been put in store. New miner's dry house, carpenter shop, and saw mill completed, and an ore dressing house 60 feet square is in process of erection, to be heated by the exhaust steam from the boilers. Underground, the main cross-cut at the 190 foot level has been driven 221 feet south and 303 feet north of the shaft, a new ore-body has been cut 180 feet north of the 10 foot vein (vein B), which dips south towards the main vein. A working cross-cut from the shaft to vein B., from the 140 foot level, is in 30 feet, and will reach the vein about February 1st. Sinking the shaft will be resumed this week. Assay of sample ore-body in west drift of vein C, gave: Copper $14\frac{5}{100}$ per cent, and $16\frac{3}{4}$ ounces silver. Sample of fines made by crusher in running through some 300 tons of ore gives 12.4 per cent copper and 5 ounces silver. Samples of fines and clean up from hand-picking tables gave 2.88 copper and $4\frac{1}{2}$ ounces silver. Several tons of these low-grade fines have been sent to Humboldt & Co., Germany, for experimental treatment. Work on the Argyle mine, which is the western extension of Coxheath, has heretofore been confined to the surface. It is the intention to sink a prospecting shaft on the property during the winter. The company is also erecting boring apparatus on its coal property at Little River, and will put down a test hole in expectation of striking the basis of the veins which crop out vertically on the same areas. The Government railroad through Cape Breton, which is located within a third of a mile from the coal shaft and within five miles of Coxheath, is being pushed by the contractors, and will probably be running at the close of 1889, thus enabling the company to ship its outputs during winter months.

The case of Putnam v. Hurdman, now before the Supreme Court, is attracting great interest in gold mining circles. The plaintiff claims to be in partnership with the defendant in gold mining operations at Oldham under the style of "The Olham Gold Company." The case occupied four days before the jury at the October sittings of the court and was continued to allow the defendants to amend their pleadings. The present application is for the appointment of a receiver, pending the final decision of the case, an extraordinary remedy only granted in cases where co-partnership is denied, as in this case, when a fraud and misconduct are shown. The plaintiff, who resides at Exeter, N.H., in his affidavit alleges the grossest fraud and misconduct on the part of the defendants. He claims to have supplied all the money employed in the

purchase of the mining property and in the opening and development of the mines, amounting to \$15,000, and that afterwards when the mining operations had become profitable, defendants attempted by false representations and fraudulent conduct to deprive him of all participation therein and of all rights in the co-partnership. Many of the plaintiff's allegations are denied, and others explained by defendants, who have filed a voluminous affidavit in the matter. Judgment has been reserved.

Quebec.

The owners of the Lake Temiscamingue silver mine, Messrs E. Wright, Geo. Goodwin and G. P. Brophy, have made arrangements to take out ore next season. There are 4000 tons of ore now on the dump. A smelter has also been procured.

The Bristol Mining Company are erecting a new Calcining Kiln at their mines, and expect to have it completed in about two weeks. If this kiln works satisfactorily it is the intention of the Company to erect several more. The Branch Railway connecting the mines with the Pontiac Pacific Junction Railway is ready for the ties which are contracted for. The steel rails will be imported by the first steamer to the St. Lawrence in the Spring.

At the annual meeting of the Lake Huron Silver and Copper Mining Company held at Montreal the following officers were elected: Messrs Thos. Wilcox, president; Strachan Bethune, vice-president; Alexander Mitchell, R. M. Esdaile and Lorn S. MacDougall, directors; F. W. Barlow, secretary-treasurer.

The mines of the Excelsior Copper Company at Harvey Hill are working full time with about 120 men in all. The shafts are reported to be developing splendidly, and the veins are becoming wider and richer as work proceeds. The company is shipping now the high grade ore to Vivian & Sons, Swansea, and the low grade ores are going to New York. From 4 to 5 car loads of ore leave the mines per week. The company will put up a large quantity of machinery on the property, and it is expected that it will give employment to between 500 and 1000 men before July. The mines are doing as well as could possibly be expected.

Ontario.

A report from St. Catharines says that while drilling on the experimental gas well on John H. Broderick's farm, a short distance west of that city, a pocket of natural gas was struck at a depth of 312 feet. The find caused a sensation. The vein will be immediately piped, but the drillers have decided to bore deeper as they feel confident a large flow will be found.

The Imperial Oil Company of Petrolea, who operate with a capital stock of \$500,000, have a very extensive and complete plant that includes over forty-six acres of land at Petrolea and over ten acres at London. They have their own wells, their own steam cooperage, where they make their own barrels, and are owners of machinery for the manufacture of patent tin cans; thus placing this company in position to place the products they manufacture into barrels or patent tin cans made by themselves, insuring uniformity of the oils, and also of what is of great importance, good, sound, uniform and regular packages of every kind.

The Sarnia Oil Company, Sarnia, Ont., has been incorporated with a capital stock of \$250,000.

The gas well at Thorold, Ont., is now emitting about 60,000 cubic feet of gas per day.

Boring operations for natural gas will be begun in a few days at a point about a mile from Ottawa.

Sudbury District.

Last month we reproduced from the *Engineering and Mining Journal* of New York some particulars regarding the management of the Canadian Copper Co.'s mines, which a late dispatch from our correspondent states to be in some particulars incorrect. Capt. Andrews is not general superintendent as stated, but is simply mining captain, and is governed entirely by Dr. E. D. Peters, jr., the able metallurgist and manager of these well equipped mines. Captain Jones, who has been with the company from the first, is superintendent of underground workings, and his thorough knowledge of this work is evidenced by the very systematic manner (all by contract) with which operations under him are carried on. It is safe to say, that without Captain Jones, the workings of the company would not have been so far advanced as they are to day. Mr. J. D. Evans, civil engineer, (also connected with the Central Ontario Railway) has had charge of the erection of the immense trestles and smelter building, as well as the laying out and putting through of the different branches of railways from each mine to smelter. Mr. John Grigg is master mechanic, and Mr. F. L. Sperry late of Yale College, is chemist and assayer. Mr. MacArthur, from Montana, is in charge of the smelting branch, and on him in large measure depends the success of this important work. This energetic officer is constantly at the works, both day and night, looking after the feeding and tapping of the ore, and lately, your correspondent is informed, he has been on his feet throughout five nights without sleep. Under his superintendence the smelting is conducted very economically. Smelting operations are carried on day and night, the ore being hauled from each mine daily by a standard gauge engine and cars belonging to the company. The roasting of the ore has turned out a decided success.

Another correspondent writes:—The Canadian Copper Co. is very nearly ready to make a start with their smelting, and the interested public look anxiously forward to see how great a success Dr. Peters will make of the treatment of these enormous deposits of copper and nickel ores. The Sudbury plant is merely preparatory, and as the ore is easily smelted, and is self fluxing, the work to be done there is comparatively simple. After a cupula smelting of these mixed ores, the resulting matter, containing 30 to 35 per cent. of the mixed metals, will for the present be shipped elsewhere for treatment, whether to Swansea or to some part of the States the management do not tell us, but it must be handled by those familiar with the separation of copper and nickel, a process for which Dr. Peters has invented and patented. About twenty piles of ore are burning on the temporary ground. These are in various stages, from thirty to ninety days of burning. They will probably average 350 or 400 tons per pile. New piles are being built on a carefully prepared permanent burning ground, over which a tramway runs from the dressing floors. This trestle is

about half a mile long, with a maximum height of about twenty-five feet, and runs over the roasting piles into the cupula shed above the level of the charging floors, where it discharges ore, fuel, etc., into bins. The cupula is in place, and fixtures on the spot. The several mines are turning out considerably over one hundred tons per day, but this does not represent their capacity; the addition of a few more miners would easily double the production, as there is ample room to accommodate an extra force mining in good ore. The present force is about 250 men, comprising miners, smelters, construction men and labourers.

The workings at the Vermillion Mining Co. are completely shut down and left in charge of a brother of A. G. Duncan. Very recently Ranger, Stobie & Tough have sold out their stock to wealthy influential parties, so that with new blood we may look for an intelligent resumption of operations, which will doubtless prove this property one of sterling worth.

Your correspondent has before mentioned the brothers Simpson, of Cranston, Ill. One or both of them has spent most of the time since May 1st in Graham Township, (lots 10 and 12, Con 2) and on these two lots have opened shafts on five different veins. These shafts are 10 feet deep on a 14 inch vein; 10 feet deep on a 30 inch vein; 25 feet on a 33 inch vein; 17 feet on a vein of 42 inches on the surface, widening to seven feet, and eight and a-half feet on a small vein of four inches. This latter is the most recent discovery. Attention was attracted to it by a show of free gold on the surface. At a depth of four feet a sample was taken of the fines made by blasting, and it yielded \$460 to the ton, with some little silver. The vein is clear quartz with copper and iron pyrites. On the 33 inch vein a 7 x 7 foot shaft is sunk. At 15 feet they struck another vein one foot wide increasing to 16 inches. Your correspondent has found \$220 in gold from one sample from this property.

Port Arthur District.

Mining operations are in a very satisfactory and progressive state, owing partly to the excellent state of the roads in the silver region, the extraordinary richness of the ore at present being produced, and likewise to the various mining companies who have already purchased outright or secured options on the most promising properties in the market. Some of the activity, especially in iron, is doubtless due to the recommendations which the Royal Commission on Ontario's mineral resources, are likely to make to the Legislature at the opening of Parliament this month. There is every reason to believe, that the commissioners will suggest that large tracts should not be locked up by mere speculators, but that a certain amount of development per acre per annum shall take place. It is also possible that an increased price will be placed on the valuable lands taken up for mining purposes.

The Badger mine still keeps the lead in the production of bonanza ore. It is almost impossible to over estimate the capabilities of this mine. It is an almost every day occurrence to see ore from this mine going several thousand dollars to the ton and not selected specimens by any means. The stamp mill will probably be in operation in a few weeks to operate in the low grade ore.

The Beaver Mine superintendent has been on a visit to his directors, and it is now announced

that Governor Alger and General Hecker have purchased Mr. Peters interest in that property, and consequently have the whole control. Sufficient headway having been made in ore output, the roar of the stamp mill will again resound through the comparatively silent valley and hills.

The Elgin Mine, controlled by the same company still continues to develop satisfactory, and four English companies having bonded the Porcupine, Beaver West, Silver Creek and Big Bear properties in the same range of hills it is more than likely that no less than seven mines within a radius of three miles or so will be making things lively before spring in that vicinity.

The Silver Mountain Mines, both East and West are presently doing remarkably well. The rich strike in the East at the 380 foot level still continues, and a new shaft is now being sunk as fast as the drills and air compressors will admit, within 250 feet of their West limit. They are likewise going down steadily with No. 3 shaft where the vein is 13 feet in width.

The Wolverine and Silver Fox Mines further to the west are still in their infancy, but getting along nicely; the latter somewhat under a cloud owing to a lawsuit *re.* a title to part of the claim.

Iron lands to the north and west of the latter, as well as at the Kaministiquia station, near Port Arthur, are being explored and taken up rapidly.

Several mining properties have changed hands at a considerable advance, in anticipation of railway facilities.

During the last few months mining in this section has received a great impetus, and the more recent reports describe veins of nearly pure silver, too rich to stamp with the ordinary machinery, and almost too massive to blast out, yielding in some instances as much as 24,000 oz to a ton of ore. This has caused considerable excitement at Port Arthur. One mine alone is making a daily output of \$30,000, or about £160,000 a month. This property is among the pioneers, while numerous others shew very large returns from ore running as high as \$1,000 to \$30,000 to the ton. The Americans are foremost in the field, owning pretty well all the mines now working. Capitalists are flocking into the country, new mines are being opened up, others are about to be developed, and new trails and roads constructed, while everything points to a veritable silver boom.—*Financial, News London.*

Rat Portage District.

It may not be generally known that among the properties whose titles are in dispute is the famous Sultana Island, ores from the gold mine of which have recently furnished such rich assays. The Dominion title to this land is held by Mr. Ham. G. McMicken and his associates in his mining business; but there is another claimant to this property, in the person of Mrs. Snow, daughter of Mr. R. Gerrie, of Winnipeg, who holds the Ontario title to four hundred acres of the island, including the mine.

Manitoba and North-West Territories.

The Manitoba Oil Company, operating in the Lake Dauphin district, has suspended operations after reaching a point 743 feet below the surface. After penetrating the limestone the drillers struck a second strata of salt, and below this a

red sandstone. The salt strata "caved," and the sand pump was lost in the "cave." The soft red sandstone was penetrated 200 feet, and it was then feared that without casing the sand pump would work across the well and stick the tools, and consequently work was suspended until casing could be procured. The American oil men who had charge of the work returned home, but the company will resume operations in the spring.

Notice is given that application will be made to the Parliament of the Dominion of Canada, at its next session, for an Act to incorporate the Saskatchewan Railway and Mining Company, with powers to lay out, construct and operate a double or single line of railway with steel rails from a point at or near Dunmore Station, on the Canadian Pacific Railway, thence northerly to a crossing at the South Saskatchewan River, at or near Downing Ford, thence across the Red Deer River near its mouth, thence by the best route to a crossing on the South Saskatchewan River at or near Saskatoon, thence in a generally north-easterly direction to Fort La Corne and a junction with the Hudson's Bay Railway or to a point on the Nelson River, with power to the said Company to vary its line a distance of twenty-five miles to the north or south of the said course, and with power to acquire, sell and work coal and other mines, and that said Act shall contain all necessary clauses for the purchase of lands, the acceptance of bonuses in land or money, or securities for money, the building of bridges, and wharves, the navigation of adjacent rivers or lakes, the construction, lease, purchase or charter of steam or other vessels for the purpose of transport of their traffic on the said navigable waters, the construction and equipment of telegraph or telephone lines, or both in connection with the railway, the erection of stations and the making of traffic or other arrangements with other railway companies, and all other usual clauses and privileges necessary for a company with such objects and purposes.

British Columbia.

Despatches from San Francisco state that Messrs. Dunsmuir & Sons, of the Wellington Collieries, have made a reduction of \$4 in the price of coal to dealers there. It is expected that this will cause a similar reduction all round.

It gives us pleasure to state that the Canadian Anthracite Coal Co. resumed operations on the 26th ult., upon an extensive scale at their mines at Banff. Mr. Winwood is the mining engineer in charge; Mr. A. Pugh, general manager; and Messrs. Ramsay and Reese, mining contractors. At present 150 men are employed. Chinese labor is employed to advantage on the breaker, and in picking coal, but none are permitted to work in the pits. Up to date, but one cargo has gone west, but we are informed that it is the intention of the company to increase the output to 500 tons per day very soon. A very satisfactory arrangement has been made with the C. P. R. as to freight.

34,393 tons of coal were shipped from Nanaimo for month ended 31st December last, as follows:—

R. Dunsmuir & Sons,.....	11,110	Tons
East Wellington Company.....	3,209	"
Vancouver Coal Company.....	20,074	"

Total shipments for December..... 34,393 "

1,050 tons of iron ore were shipped from the same port during December, ex steamer Fern-dale.

Following is the coal output for the year 1888; a very satisfactory increase:

	Tons.
R. Dunsmuir and Sons.....	200,000
Vancouver Coal Co.....	259,432
East Wellington.....	35,809
Total.....	495,241
Output of 1887.....	410,573
Increase.....	84,668

Mr. Robert Scott, for many years an overman of the Wellington Collieries, has been awarded the contract for sinking a shaft for the Vancouver Coal Company, on what is known as the Company's North Field, and contiguous to the Wellington Colliery property. Mr Scott severs his connection with the Wellington Collieries at the beginning of the year and in about ten days time will commence the sinking of the new shaft. It is expected that the coal will be reached in about 250 feet from the surface—*Nanaimo Free Press*.

The No. 6 Shaft of the Wellington Collieries is now down to a depth of 170 feet. It is expected that the coal will be reached at a depth of 250 feet. The shaft is therefore about half way down to the coal.

The miners at the Wellington Collieries decided, at a meeting held on 2nd instant, that unless the men engaged in getting out pillars received an increase in their present rate of pay they would go out on strike. The mines were consequently shut down. At time of writing we have not heard whether any arrangement has been come to.

The following figures will show the output of coal from the Wellington collieries for the past fifteen years:—1874, 81,000 tons; 1875, 110,000 tons; 1876, 139,000 tons; 1877, 154,000 tons; 1878, 171,000 tons; 1879, 241,000 tons; 1880, 268,000 tons; 1881, 228,000 tons; 1882, 282,000 tons; 1883, 213,000 tons; 1884, 394,070 tons; 1885, 365,000 tons; 1886, 326,636 tons; 1887, 413,360 tons; 1888, 487,784 tons. It will thus be seen that the output from these mines was not only far in excess of any previous year, but that 74,424 more tons of coal were taken out than in 1887.

Commenting upon the strike at the Wellington collieries the *Nanaimo Free Press* of 11th says: The situation at Wellington during the past 36 hours has assumed somewhat alarming proportions and it now appears as if the present attempts of an amicable settlement would end in a failure. The miners at their meeting yesterday afternoon refused flatly to accede to Mr. Dunsmuir's propositions as reported by the committee who interviewed him on Wednesday last in Victoria. This is certainly an unfortunate state of affairs and it is to be deplored by all parties as "strikes" and "lock-outs" are not only detrimental to the miners and the mine owners but it affects all classes in the city and district, and already its deleterious influence is beginning to be felt. Nor is that the only bad aspect of affairs for this morning comes the news from Victoria that Mr. Dunsmuir has instructed Mr. Bryden, Superintendent of the mines, to serve the miners with an order to vacate the company's houses, nor will they be paid for last month's work un-

til they conform to the general rule of removing their tools from the mines and deliver them to the store-keeper.

The following are the shipments of gold from this province for the past year as reported by Messrs. Garesche Green & Co.:—

1888.	Bank of British Columbia.	Bank British North America	Garesche, Green & Co.
January.....	\$ 5,580 44	\$ 580 00	\$ 2,100 00
February.....	12,346 80	2,521 60	1,983 90
March.....	9,445 35	4,930 00
April.....	20,712 43	1,880 00	5,487 00
May.....	18,117 35	2,215 00	6,393 00
June.....	26,841 53	5,616 88	10,445 00
July.....	29,771 53	4,158 00	13,045 00
August.....	29,500 13	5,950 00	18,308 88
September.....	41,019 03	6,644 80	15,305 04
October.....	35,230 55	4,619 00	15,949 00
November.....	36,292 93	13,419 00	25,813 00
December.....	22,564 98	3,960 00	13,695 00
Total.....	\$287,423 05	\$51,564 28	\$ 133,454 82

RECAPITULATION.

Bank of British Columbia.....	\$287,423 05
Bank of British North America.....	51,564 28
Garesche, Green & Co.....	133,454 82

Total for 1888.....	\$472,442 15
Total for 1887.....	578,924 52

Decrease.....\$106,482 37

From the above it will be seen that the export by the banks has fallen short by a considerable amount. It is not owing to a decreased output, for Cariboo furnishes a somewhat larger sum than in 1887, and reports from other sections are said to be equally good. The apparent deficiency is rather thought to have been caused by the shipment of gold by other channels than those which have heretofore monopolized the field.

The Petroleum Fields of Ontario.

ROBERT BELL, B. A., S.C., M. D., L.L.D.

(Continued from December Issue.)

The drift clay of Petrolia is so impervious that tanks excavated in it and lined with wood are found to be capable of holding the oil, and large quantities of it are stored in this way. These receptacles are circular in plan, and the largest are forty feet in diameter by fifty and sixty in depth, but those of the average size are thirty feet in width by thirty five feet in depth. They have a total capacity of 600,000 barrels. The largest of them are owned by tanking companies. On November 1st, 1886, ten of them were full, and Mr. W. K. Gibson informed the writer that the aggregate of oil which they then contained was 415,000 barrels. The same gentleman gave me the following as the stocks of oil on hand on December 31st, 1885: in tanks at the wells, 36,000 barrels; in the tanking company's tanks, 373,504 barrels; crude oil and its equivalent at the several refineries, 38,372 barrels, or a total of 447,876 barrels. At 85½ cents per barrel in the tanks, which was the actual mean rate at which crude oil was sold during 1885, this would represent \$382,934. The average selling price of the illuminating oil in 1886 was 14½ cents per gallon. Formerly the crude oil was sent to London (Ontario), Sarnia, Montreal, and elsewhere, to be refined, but now the whole of it, except about 5 per cent., is treated at Petrolia, in nine distilleries and refineries. The stills are great elongated cylinders, the largest

of them capable of holding from 275 to 300 barrels of petroleum. The six stills at the Producers Works, when in operation contain 1,600 barrels, or 266 each. These are arranged side by side, to the number of six to twelve or more, on a brick "bench," so that the fire can reach their whole length beneath. The fuel consists of water and the refuse tar, strongly injected together from a nozzle. Mr. James Kerr, who is thoroughly versed in the chemistry of petroleum, and acts as inspector for the refiners, gave me the average commercial constituents, per cent., of the crude oil of Petrolia, as follows:—

Naptha	7.72
Burning oil of the Government standard	49.50
Gas oil	14.74
Lubricating or paraffin oil	9.65
Intermediate oil	4.00
Paraffin wax	1.41
Hard coke	3.75
Soft coke and waste	9.23
Total	100.00

During 1886, the average number of pumping engines at work in the district was 75, or one to every 35 wells. They had an average of 18, and a total of 1,350 horse-power. About 30 engines, with an average of 15, or a total of 450 horse-power, were employed in drilling. In addition to these, the refineries, shops, lumber-mills, etc., connected with the oil industry, employed about 50 more engines, with an average of 40 and a total of 2,000 horse-power, to say nothing of the locomotive power required on the railways, etc., to transport the products. Large numbers of horses are used in hauling the crude and refined oil, the machinery, lumber, and supplies of all kinds required in the business. The total number of men and boys employed in connection with the oil industry of Enniskillen is about 2,000, and these would represent a population of about 10,000 dependant upon it. The town of Petrolia and its suburbs contain about 6,000 inhabitants. Besides the above, about 200 more men and boys are employed in connection with the refining, etc., of the crude petroleum sent elsewhere; and in a less direct manner, the products of the Ontario oil-field help to swell the general volume of the carrying and other trades of the country. It would be difficult to give a correct estimate of the capital employed in the business, but it must amount to several millions of dollars. The wages of experienced well-borers and distillers are \$1.50 to \$2.00 per day, while labouring men receive from \$1.25 to \$1.50. All the operations are carried on by native Canadians, who have, by their own ingenuity, developed each branch of the business to its present perfection, by carefully studying the necessities of the case. This has afforded an excellent mechanical education to a large number of intelligent men, whose services are now sought for in every oil-producing country in the world. We hear of them directing the boring, pumping, storing, and other operations connected with the petroleum business in Galicia, Russia, Afghanistan, Belochistan, India, Burmah, California, Australia, etc., where their skill and knowledge are highly appreciated.

Excelsior Copper Company.

The first ordinary general meeting of this company was held on Monday, 10th December, at the Cannon Street Hotel, Colonel Malleon, C.S.I., presiding.

Mr. Geo. Roe Fenwick (the secretary) having read the notice convening the meeting,

The Chairman said that since the formation of the company the board had determined to send out Colonel Gay to the mine to extend and develop it. At the same time they ordered the amount of machinery necessary to turn out 100 tons per day. Colonel Gay arrived on November 12th, and he had sent home reports of a highly satisfactory character. He stated that the mine was in excellent order, and although the machinery at his disposal was comparatively imperfect, he had been able to ship consignments of ore regularly. The company had received on the first shipment 33 tons of ore, on the second shipment 40 tons, and on the third shipment 56 tons. It was not, he thought, an unsatisfactory feature, as indicating the appearance of the mine, that the tonnage had advanced on each shipment. They had gone from 33 to 56 tons, and Colonel Gay's letters encouraged the board to hope that future shipments of ore, when the improved machinery was put up, would be of much larger tonnage. (Hear, hear.) In every way the reports from the mine were therefore satisfactory, especially when it was borne in mind that at present it was only the debris left by former miners that was being worked. The company had about 30 tons of ore lanked, which was being sent rapidly to the station. All the letters received from Colonel Gay were of the same character, and if there was one feature in which they differed, it was that each succeeding letter gave a more promising account of the mine than its predecessor. (Hear, hear.) It appeared that the lodes were extremely well defined, and the quality of the ore excellent. Messrs. Vivian & Son, who received the first shipment of ore, wrote to-day: "Concerning ours of Saturday, we have just received a telegram from our Swansea friends, advising us that the reason they have not been able to send account sales for the ore, as expected, is that they have been unable to obtain reference assays which they were having made as a check on their own. These have been made this morning, and are as follows:—12 bags, 31½ per cent. of copper; 45 bags, 49 per cent. of copper; 46 bags, 12¾ per cent.; 22 bags, 13½ per cent.; 240 bags, 14½ per cent.; 32 bags, 51¾ per cent.; 55 bags, 31¾ per cent.; 90 bags, 40¼ per cent.; sweepings from the above, 18¼ per cent." Considering the ore shipped home was the debris or mixed with the debris left by previous miners, the return was very satisfactory. (Hear, hear.) In a short time the company would be obtaining richer ore, and he had no doubt that it would be received in England in the quantities mentioned in the prospectus. He would be happy to answer any questions that shareholders might think fit to ask.

Mr. Simpson asked what proportion of the £50,000 had been subscribed, and as to the machinery sent out.

The Chairman said that the company went to allotment on £15,000, that being sufficient, according to estimate, to provide the necessary machinery to make returns, and shareholders would agree that no time had been lost in making those returns. (Hear, hear.) The value of those already made was some £3,000 or £4,000. With regard to the machinery, £500 worth had been sent out in the first place, and finally £1,000 worth. The board had sent out exactly what was requisite according to estimate.

Mr. Simpson further inquired whether the board were corresponding with the mine manager each week.

The Chairman said that up to the present time they had received letters always once a week, and sometimes twice, in addition to cablegrams. A cablegram to hand that morning stated that a further consignment had been despatched, and that another would follow on Wednesday. (Hear, hear.)

Mr. Simpson asked if he might assume from that that almost daily shipments were being made.

The Chairman said that they were being made, if not daily, at all events twice a week. In fact it was impossible for the mine to present a more satisfactory aspect than it now did. It had begun to give returns at once, and those returns were increasing weekly. (Hear, hear.)

This terminated the business of the ordinary meeting, and an extraordinary meeting was convened.

The Chairman said that the company had been formed under Table A, and while that table gave certain powers to the directors, those powers were too indefinite, and it had been deemed advisable to draw up a fresh code of the constitution of the company, which would give the directors definite powers to act without coming to the shareholders for every detail. (Hear, hear.) Copies of the new articles had been sent to the shareholders, and he proposed that they be substituted for those now existing.

Mr. T. H. Scarborough seconded the resolution, which was unanimously carried.

This terminated the formal business of the meeting, and

The Chairman said that the board were so satisfied with the character of the letters received from Colonel Gay, that they were open to the inspection of any shareholder. It was impossible for any member of the company to read those letters without sharing in the enthusiasm with which they evidently were written. (Hear, hear.) Colonel Gay had seen the mine before he was connected with the company, and was so impressed with its value that he had staked his whole future on its success. He had given up a very lucrative business in England to go out and manage the mine, and had put what money he could spare into it. Those were facts which spoke volumes. (Hear, hear.)

A shareholder asked if Colonel Gay had had any previous experience of mining.

The Chairman said he believed that Colonel Gay had been formerly engaged in mining in California.

Mr. Simpson proposed a vote of thanks to the chairman, which was unanimously carried.

The Chairman, in acknowledging the vote, said that the interest of the directors was that of the shareholders, and he felt that, judging from the successful commencement under Colonel Gay's auspices, the company would achieve a very great success indeed.

Quartz Mining in British Columbia.

If placer mining is on the decline, or rather stationary, it is not so with quartz mining. The signs of the times are that this Province will soon hear the hammer of many stamps pounding out the precious metal, and see the glare of the furnaces smelting the base from the pure. In all sections of the province the miner and prospector have been at work, and many known claims have been developed sufficiently to show that they will repay practical working, while the number of gold, silver, galena and copper deposits which have been brought to light for the first time, will mount up into the hundreds. In Lillooet, Nicola, Okanagan, Rock Creek, Cherry Creek, and other districts, and especially in the large district of Kootenay a great amount of practical work has been accomplished.

The country bordering on Kootenay Lake has been shown to possess gold, silver, copper and carbonate deposits of amazing richness, and several carloads of ore, which were shipped with difficulty and enormous expense to Helena and Butte smelters, have returned handsome sums to the hardy and enterprising shippers. Enough has been done during the year just passed to show that in the Kootenay region there are mineral deposits which bid fair to rival in richness the mines which have made Virginia City, Nevada, famous. Hundreds of men are now in the region, and it is assured that many thousands will visit it during the present year. Capitalists have also travelled the rough trails to inspect the mines, and it is gratifying to know that several have made investments, and will open up the mines acquired. There is also good reason to believe that the Ainsworth & Co's charter for a railway connecting Kootenay Lake and Columbia River will be carried to completion by the C.P.R. The Manitoba road, which is pushing westward from Helena, is also likely to pass within a few miles of the British Columbia boundary, and this will furnish cheap and easy access to and from the mines, and of shipment of ores to smelters at Helena and Butte.

The mines at Field have already begun the shipment of ore to the smelter at Vancouver, and the silver and copper mines of Jubilee Mountain are being opened up as quickly as the means of locaters will permit. In many other sections of Eastern and Southern Kootenay quartz has been paid considerable attention to, and the prospects are bright indeed for rapid advancement towards the production of bullion.

At Illicillewaet, in the Selkirk range, also in the Kootenay district, this year the work has been altogether confined to the opening out of the silver mines located there. The Selkirk Mining Co. have run in several tunnels at various levels, and have determined a permanent vein of ore averaging over \$100 per ton. The Corbin & Kennedy claims have been further opened up and are developing to the thorough satisfaction of their owners. A road is being built by the government up the north fork of the river, and when this is completed it will enable the cheap carriage of ores to the railway track.

At Stump Lake, in the Nicola district, the Nicola Mining Co., composed of English capitalists, have carried on considerable work in developing their mines. Several shafts have been sunk to a depth of two hundred feet, and cross-cuts run at the fifty and one hundred foot levels. The shafts are to be sunk to a depth of three hundred feet. A tunnel has also been run in on one of the ledges, tapping it at a depth of one hundred feet. The ledges are from two to three feet in width, and the ore, which is of a paying character from the surface, improves in quality as depth is attained. As soon as the company is thoroughly satisfied with their permanency and value, the ledges owned by them will be worked on an extensive scale. Other mines in the neighborhood have been worked, one company shipping a quantity of concentrates to San Francisco. However, the means

A new Ottawa enterprise.—Before many days are over we shall have in full operation at Ottawa a first class Lapidary Establishment. The upper flat over the Automatic Refrigerator Company's store on Wellington street has been secured and is now being fitted up with the most improved machinery for lapidary work of every description. This is a step in the right direction, and the promoters of the enterprise hope to meet with the support of our manufacturing jewellers, who are now entirely dependent on the foreign market for material. As they are not, as a rule, mineralogists, and therefore easily deceived in a gem by being guided by its color, this difficulty may now be obviated by dealing with the Ottawa Company, who are mineralogists, and every stone cut by them and named may be relied upon. All kinds of gems will be cut; also slotting and polishing of every variety of stone.

employed to save them were on such a limited scale that there was no profit in the transaction. There is no question, though, that if worked on a business basis the mines would return a fair profit. They are adjacent to wood and water in large quantity, situated in a country where a wagon can be driven to any of the mines, and within reasonable distance of the C. P. R., which company will likely build a branch line into the district if mining is proceeded with on a large scale.

At Rock Creek the permanency and richness of the ledges there have been fully established, and one company at least will proceed with the work of reducing the ore to concentrates. It is partly free milling. A carbonate deposit also exists near the gold leads, and ore is now being shipped from this to a smelter. A new discovery was made twenty-five miles from Rock Creek, near Okanagan Lake, of gold, silver and copper deposits, which give promise of being good properties.

In Lillooet district a large amount of prospecting work has been done, and several claims are being opened up with good prospects. Several extensive ledges of free milling ore were located during the summer, and these will be thoroughly investigated during the present year. One on Anderson Lake, exposed on the steep side of a mountain, is especially promising, being rich in gold and readily worked.

In Cariboo district, and especially in the neighborhood of Barkerville, a good deal of attention has been bestowed upon the quartz ledges. One small stamp mill was erected, and is now working free gold ore in Black Jack Gulch. A test smelting works, erected by the government, is just completed. It has been built for the purpose of treating ore in quantity from the mines which are being opened out in order to determine their quality. The disadvantages of being nearly three hundred miles from a railway line has prevented the shipping of ore, and it is expected that the government works will fill a want long felt. They have not been erected for commercial purposes, but simply to aid in the development of the innumerable ledges which exist in the hills surrounding the famous Williams creek and its tributaries, and which are known to be rich in mineral. The treatment of a number of tons of ore from any ledge will, it is thought, prove whether it is worthy of extensive development. This determined, capitalists will be induced to turn their attention to Cariboo, which has sent out so many millions of dollars from its placer mines. It is, with good reason, believed that the quartz ledges will, in the near future, produce greater wealth in bullion than ever was taken from the alluvial deposits.

On Vancouver and Queen Charlotte Islands, in the Archipelago and along the coast, ledges containing gold, silver and copper have been slightly developed, but there has been so far no great discovery. Ledges containing rich deposits of mineral are believed to exist, but the luxuriant vegetation prevents their easy discovery. Time and the elements and fortunate accident may yet unearth mines that will prove of astounding richness.

Altogether the outlook of the quartz industry is very cheering, and before 1889 has sped it is confidently hoped that bullion in no mean quantity will have been produced. British Columbia possesses the mineral. All that is needed is capital, and even that, somewhat tardily, it is true, is coming to us.—*Colonist*.

The Port Arthur Mines.

(Manitoba Free Press.)

The Silver Mountain group comprises a number of veins situated about the eastern extremity of Jack Fish Lake, in the Township of Lybster, and along by White Fish River, the principal vein in this group being Silver Mountain vein itself, on which work has been going on for some years. It is worked at both the east and west end, known as Silver Mountain East and Silver Mountain West, the locations being a mile apart. It is a strong vein throughout, but yielding far larger returns to the west end company than to the east. Both mines are well equipped with machinery, and a good road constructed by the Government leads to Murillo Station, twenty-five miles distant. While the west end mine is turning out the best ore, it cannot be expected that the east end, owing to its position, will long undervalue it. This mine is contracted by an English company. In the Beaver and Badger group the veins number about a dozen, all lying within a radius of about three or four miles. Four of these—the Badger, Porcupine, Silver Creek and Little Pig—are located within a mile and a half stretch of country along the west bank of Silver Creek, at the foot of a bluff or trap-covered ridge. The first mentioned of these, the Badger, is at present a bonanza mine. It has only been in operation for one year, but in that time has yielded big returns to its company. It is controlled by an American company, as indeed most of these mines seem to be. Heretofore the development has been going on very slowly, the Company, chiefly a directorate of merchants, being very cautious, but an increase in men and machinery has lately been made, and the mine is now assuming a

business-like air more in accordance with its yielding capacity. Some sixty or seventy men are employed, while the whole location number about one hundred people. During the past summer the clearing has been largely extended, and now a clear plot of two hundred acres in the forest stretches from the head of the vein to Silver Creek. A number of substantial log houses have been put up, a supply store and a stamp mill awaiting its machinery, a large part of which is already on the ground. Sinking has been carried on pretty steadily here, and they are now about one hundred and fifty feet from grass. The silver ore was struck, when the vein left the trap overflow, ten feet of which covered the slates here, and it has continued wonderfully rich to the present time, when it now looks as if the Bonanza had reached its end. However, this is still a mere speculation and it remains to be seen what further blasting will bring to light. The vein continues a good width, being three feet or more in places and though the pay streak has diminished to three or four inches, further sinking may show the rich zone still strong. Drifting has been quite extensively carried on also, three levels or galleries having been driven some distance east-west of the shaft, the two upper levels being air levels, or drifts, as technically called, opening into day at the east side, the slope of the valley. Steam twisting gear has been put in, and forty or fifty car-loads or more can easily be lifted to the bank in ten hours. The main rock is then trammed from the upper level out to the rock house; the slate which is picked out underground is also hoisted and dumped along the trestle. The pay ore, when it has reached the rock house, is carefully picked over, being first washed with hot water carried in pipes from the boiler, so that the silver may be readily detected. Two classes of ore are made; the first class, known as smelting ore, is carefully cobbled and graded into three grades, the first grade assaying from fifteen hundred upward to ten thousand dollars per ton; the second averaging three or four hundred to nine hundred dollars; while the third class is made up of ore carrying Galena i. e. lead, and which the smelters prefer in a separate lot for the convenience of reduction. The rich ore is then disposed of, while the balance, known as mill-rock, a stamp-rock constituting the lean or hungry portions of the vein, and assaying from fifteen to a hundred dollars or more per ton, is trammed to the mill to be there crushed, concentrated and amalgamated. It is no exaggeration whatever to say that wonderfully rich ore has been taken out of this mine. Nuggets of black sulphide of silver, weighing from one to six pounds, I have myself handled, and are knit through and through with fine wires of native silver, so that the "gangue," or accompanying rock, could scarcely be discerned is not at all uncommon. The rich ore is then assayed, great care being taken that the sample will fairly represent the average yield of the vein, barrelled and shipped to the States to be smelted. One shipment of forty barrels was recently made which yielded a return of nearly forty thousand dollars, and at the time of my leaving another shipment was in readiness. The smelting ore so far yielded by this mine is alone sufficient to wipe out expenses and pay a very respectable dividend to the shareholders. It is proposed to put the mill in running order in the spring, when the three or four hundred tons of stamp-rock already on the dumps will be disposed of at the rate of ten or twelve tons per day. This mill will not be the customary stamp crusher, viz.: a set of five, ten or twenty stamps, but one large sized stamp working in a mortar, which will be open all round the bottom to allow for the passage of the crushed ore. This contrivance, I was given to understand, is quite a recent innovation in milling machinery, but from the satisfactory accounts given of one already in operation in the Calumet and Hecla mines of the South Shore, it is to be presumed that this will work equally well. In this mine, as yet, there has been no occasion for artificial ventilation, since the air levels form a draught with the shaft acting as a flue, a strong current of wholesome air is kept continually circulating. So far as timber is concerned the poplar wood answers for house building, while a saw mill at the Beaver mine, a mile and a half distant, furnishes lumber; but a difficulty to be overcome in the mining engineering is the lack of pine or tamarack timber of sufficient girth and strength for stopping purposes and timbering the shaft, much of the larger timber having to be carried several miles. At present a large gang of men are employed underground, working alternating shifts of eight hours each; but as development proceeds, I am informed that their force will be largely increased.

Adjoining the Badger property lies the Porcupine mine, which was at one time in full blast, as a large clearing, some shanties and a shaft-house indicate, but, owing to financial difficulties, at present it is shut down. The vein is two or three feet wide at the surface, and though I had no opportunity of going underground, the levels being closed and the shaft full of water, the stamp rock on the dumps looks very promising. The man in charge of the location showed me some of the best ore which

had been stacked in the shanty close by, and it can safely be said this vein will prove, when fully developed, one of the best mines in this district. A company, composed of Canadians, and headquarters in Port Arthur, I believe, is about to begin operations on this mine very soon. It has two veins a little to the north of these, the Silver Creek, and Little Pig, which have been tested by trial-pits and proved satisfactory, and only await the necessary capital to begin sinking. This last mentioned is an unusually strong vein, and one on which, owing to its position along the side of a bluff, a stone-throw from the Government road, would be easily mined.

The Beaver mine, already famous among silver mines, I had the opportunity of spending a week at, seeing both its surface and underground equipment. This mine is an excellent instance of what an enterprising mining company may do in this region. It is now three years since this mine was opened up, and it has worked unceasingly since that time. The mine at first yielded a big bonanza, which naturally played out, but sinking was continued till rich ore came again in sight. Now that it has experienced some of the difficulties to be contended with in this region it has developed into a settled organization—working, yielding and paying. It has changed management and mining captains several times, but this has not for a moment impeded the work. At one time this mine employed two hundred men. Its machinery is of the best, and its mechanical appliances throughout, both on surface and under ground, good. There is a large mill with a capacity of 30 tons per day on this location, but at present it is inactive. I am informed, however, that crushing is to begin in the spring, sufficient stamp-rock being at present on the dumps to keep it constantly at work crushing for three years. This vein intersects a mountain, in some respects making it easily mined. While, however, there was plenty of opportunity to run air-levels, and thus make easy ingress and exit for the men, it necessitated sinking the shaft in the summit, while all the hoisting plant had to be placed at the foot of the mountain. This required a thousand feet of cable to run up the mountain side and on to the shaft-house to lower and raise the "cage," but all has been successfully accomplished, and the mine works with thorough system day and night. The inflow of water, a difficulty so often met with in mining, has not been a serious one to contend with here, nor has it been to any extent so in any of these mines. They are three hundred and fifty feet from "grass" in this mine, have driven five levels, three of which are air levels, i. e., opening into day, and are at present sinking the shaft or drifting on the sixth level. While richer zones than the one they are at present working in have been passed through, it is not impossible, in fact it is quite probable, that a bonanza streak may be again encountered. As it is, however, the ore coming out is of excellent quality, showing in liberal quantities both sulphide of silver and the metal itself. This mine is fully equipped with air drills controlled by a powerful compressor. The wages here, as in the other mines, run from one dollar and a half to three dollars per day. The miners employed in these mines are of all nationalities, a large number of Cornishmen, who are capital miners, being employed as well as Swedes, Finlanders and Italians. These latter, however, I am informed, are objected to sometimes by the other workmen on the ground that they are willing to work for less money. This should not, however, deteriorate their services in the eyes of their employers. Drinking has been forbidden on these locations, but this does not prevent an occasional spree at Port Arthur or the Half-way House, which indiscretion, however, seems to be occasionally allowable in miners the world over. When in full working order a location presents the appearance of a small village, with its dwellings, boarding-houses, general store, butcher shop and school. Indeed, it may be called an incorporated community, having, in place of a reeve and councillors, a manager, with his sub, the mining captain, controlling underground work, the master mechanic, assayer, etc., at whose beck and nod the regulations and funds are doled out. It was during my stay at this mine that I took the opportunity of visiting the Rabbit Mountain Mine, located about three miles to the southeast, and reached by a trail through the woods. This location discovered by an Indian some five or six years since lies in a hollow between two trap bluffs which almost exclude the light of day, and in winter I have heard that the sun only shows himself for two hours during the day. A group of shanties lies about the shaft along with a mill and a hotel, the latter bearing the pretentious name of the Windsor House. It was through the proprietor's kindness that I was furnished with most of my information concerning this mine. No work is going on here at present; a full supply of mining and mill machinery, all set up, stands silent, and the shaft, some two or three hundred feet deep, is full of water. This vein showed an unusual width on the surface, and continued wide and regular throughout the sinking, being when abandoned seven feet in width. The rock, however, I am informed, was good average mill rock, but a sudden decrease in assay returns shook the faith of the St. Paul Co. and it was dropped. The plant, a most ex-

cellent one, consisting of engines, compressor, with a capacity of nine drills, first-class pumps and a full mill plant of five stamps, vanners, and concentrators, and sufficient room to increase the crushing power to ten stamps if needful, stands waiting for an energetic company to oil up with sufficient grit and capital. About a mile distant from this mine lies the Caribou and Big Bear locations, both promising mines, I am informed, and on both of which sinking has been carried on to some extent. As regards the third group of mines situated at the margin of Lake Superior, I am not prepared to make any definite statements. The Jarvis Id. mine, under the management of an English company, has been shut down, but that the character of the ore fully warranted it I do not know. From personal observations I have concluded that this region must eventually take a prominent part among silver mining regions. My reasons for so believing are these: First, the nearly universal excellence of the ore—while much is rich, it is all good average stamp-rock; second, the close proximity of the ten or twelve veins in the middle group (all within a radius of three or four miles) leads one to believe this belt has plenty of outcrops still awaiting the prospector's pick; third, as the depth increases the value of the ore does not necessarily decrease, as the richest ore is in zones or "pockets," liable at any moment to come into view; fourth, it is as yet a new mining region, and but awaits the thorough and satisfactory trial of one or two mines to ensure the success of all; fifth, the geological indications are favorable—the veins are all north-west and south-east, being true fissures. I have already mentioned the difficulties to be overcome so far as I know. What seems to be needful are companies, comprised in part at least of mining men, with sufficient capital to push the work when threatened with a decrease in returns.

The Treatment of Ores.

NOTES ON THE SELECTION OF A PROCESS.

I.—Free Gold Milling.

(Mining Journal.)

The difficulties attending the selection of the best process of ore treatment being dependent in most cases upon local circumstances, and upon the intricate and complicated composition of the ores, it is not possible to lay down exact rules covering all cases; but the following notes will serve to indicate the principles of the processes most commonly followed, and will furnish a guide for general application.

Free gold milling is essentially applied to ores containing gold in the free state; but as a preliminary process it is commonly employed on ores in which the gold exists, partly combined with pyrites of copper or iron, the free gold being first extracted and the auriferous residue subsequently treated by a more suitable process. The successful treatment of ores containing gold in the semi-free state necessitates, however, such extremely fine crushing that in many cases it would be more economical to adopt a smelting process at once instead of passing the ore through a preliminary process. Gold milling is of all the most simple method of gold extraction, but its application is limited to the treatment of ores containing gold wholly or partly in the free state, and is not suitable for the extraction of the precious metal when chemically combined with the other metals of the ore.

In free milling the ore is first crushed wet under stamps or rolls, and in cases where the gold is disseminated in fine particles the ore is afterwards pulverised. The pulp is then passed over copper plates whose surface is quicksilvered, the gold attaching itself to the quicksilver in the form of amalgam, which is collected at intervals and retorted. The process is not only the most simple but is by far the cheapest, ores containing not more than \$2, or under 2 dwts. of gold per ton, having in well arranged mills and under favorable circumstances, just paid the cost of treatment, and in the Black Hills ore yielding \$6 or less than 8 dwts. per ton (calculating the value of retorted gold at 75s. per ounce) can be

worked to a profit, including the cost of mining as well as of milling. This, however, would not be an absolute guide as to cost, the minimum cost of working this process being of course, contingent on local circumstances such as cheap water power and labor. The adaptability of this process can be easily and expeditiously tested by panning down a finely crushed sample, when the gold, if free, will be at once made visible, and after concentration may be amalgamated with mercury and distilled out. In most cases, however, auriferous ores contain other metals generally in the form of sulphides, principally those of iron and copper, rarely of lead or zinc, and occasionally various tellurides, notably those of silver with small quantities of gold such as sylvanite and hessite, and of lead, as altaite and nagyagite. The presence of these metals renders necessary a modified method of treatment. In the first place the sulphurets must be concentrated and rendered clean from the gangue of the ore. This may be roughly done by passing the finely crushed ore over blankets or hides, collecting at intervals the deposited sulphurets, but it is a crude and imperfect method entailing much loss in the form of fine mineral carried away by the necessarily strong stream of water, and imperfect separation by reason of portions of the gangue being mechanically arrested in the crevices of the blankets or hides. The minimum gold contents in sulphurets ores that will pay to extract by subsequent methods, such as chlorination or smelting, and leave a margin to cover the cost of these operations and of the concentration, will depend in almost an exclusive degree on the perfection of the dressing machinery employed. It is quite impossible to lay down any rule which would be a guide in this respect. It is quite evident that no one machine can be adopted to the numerous classes of ore of distinct physical properties; for instance, the ore may contain minerals of nearly the same specific gravity as the gangue; again, the precious metals may be contained in minerals of varying densities; and again such minerals may be of different hardness and cannot be pulverised to any equal degree, which is one essential condition to satisfactory concentration.

The most suitable method of treating the freed sulphurets will depend mainly on local circumstances. Where the concentrates are rich and the cost of transport not heavy, it becomes a question whether it would not pay best to send the ore direct to the smelting works, for such ores—auriferous sulphurets—always command high prices on account of their co-agency as a flux (after calcination) in the treatment of other ores of the precious metal. In California the concentrated sulphurets are chlorinated (after roasting) by exposure to chlorine gas whereby the gold (rendered free by the roasting) is converted into a soluble chloride, and afterwards precipitated. The cost varies in this district from 30s. to 40s. per ton of concentrated ore, but this cost is, perhaps, exceptionally low, and would be little guide for other districts where the expense of labour, fuel, and chemicals may be higher. In such case the better mode of treatment would be by roasting and amalgamating or smelting, the latter especially when the auriferous ore contains copper, or where lead ores are available, in either of which two metals the gold may be concentrated with but little loss. This process cannot well be used on ores rich in silver. In such cases the silver is best extracted by the Mexican "Patio" process, the "Augustin" process, the "Ziervogel" process, or the "Pakra" pro-

cess, in all of which the silver is converted into a chloride by the agency of common salt, and afterwards dissolved out. A detailed description of each may be found in any good work on the metallurgy of the precious metals.

(To be continued.)

Mine "Booming" Extraordinary.

(MINING JOURNAL.)

America, as we all know, is the land of "big things," and there should be no doubt in the mind of its admirers as to the ability of its inhabitants to "lick creation" in any direction the genius of its people may suggest. If our cousins claim this as an universally applied truism, we should hesitate to allow the contention, but in mining matters we will not contest the claim. In this direction they have fairly outdone themselves in 'cuteness. In what way, our readers will not take long to discover from the *expose* of the Arkansas mining frauds which has been recently made in American papers. The story of this remarkable mining boom, which commenced in 1885 and was told in American papers at the time, will profitably bear repetition. For some years past there appears to have circulated amongst the good people of Arkansas a legend that the country was immensely rich in mineral wealth, that this wealth had once been drawn on by its former inhabitants, the Spaniards, who, on their ceding the country to France, managed to obliterate every trace of their mining exploits. The belief in this absurd story appears to have been pretty generally held, for it was carried down to the present day. In particular, the story seems to have received most credence in its relation to a certain mine called the Louisiana, which was the envy of the mining world when in the hands of its discoverers, the Spaniards, which is more than can be said of it to-day. The subsequent discovery of this old mine would be more remarkable than the legend itself, were it not that to be sceptical on the one would imply disbelief in the other.

Its history is this: Some thirty years ago, an adventuresome band of proselytes to the legendary faith, who appear to have had more confidence, than either brains or money, commenced a campaign of exploration to discover this abandoned, and concealed mine, but they soon gave up the task although it was believed at the time and subsequently that they were "on the track." However cupidity came to the rescue of incredulity once more, and the legend was again revived in its most attractive form. Whether through faith in the legend, or using it merely to work on the credulity of others, a new band of adventurers determined to seek for the Eldorado of the Spaniards, and soon gave out to the world that they had found it. A company, called the Lost Louisiana Company, was at once incorporated under the laws of the State, with a modest capital of 1,000,000/., out of which the adventurers pocketed 600,000/.? The excitement which followed this supposed discovery was immense, and the country became a huge mining camp. "Every unfamiliar rock (says the State geologist) was regarded as a valuable ore, or as an 'indication' of something." Within three years the total capital stock of new companies incorporated in the State amounted to \$111,000,000. Most of these companies, however, turned out such miserable failures that State intervention was sought, and the State geologist called upon to furnish a report on the mines. After describing the origin and progress of this remarkable boom, the report goes on to state:

"The authors of this excitement have persuaded people, whether honestly or fraudulently makes but little difference, that the ores of this region are 'peculiar,' and only required some new process to get gold and silver out of them. This delusion has been kept alive by assayers, some of whom were perhaps sincere, but some of them certainly fraudulent."

So persistently was this theory advocated that it became a question of life or death to the mining industry of the State—at least, so far as the precious metals were concerned—and in order to test the contention, a trial of the Lost Louisiana ore was carried out in the public sampling rooms of the St. Louis Sampling and Testing company, the operations being conducted under the watchful eyes of two officers of the company, Messrs H. A. Wheeler and Arthur Thacher, who were to be enlightened as to the proper method of obtaining gold and silver from this "peculiar" ore. And enlightened they were! The Arkansas assayers were Mr. A. M. Beam and "Professor" Aughey. Altogether 19 assays were made from samples taken from 46 lbs. of the Lost Louisiana ore. In two cases gold was found to the extent of 8 and 11 6-10 ozs. respectively, and the remaining tests showed only traces. But the funny part of the *expose* which followed is this—that Mr. Thacher has certified that Prof. Aughey omitted to put in the ore when the first result was obtained, and Mr. H. A. Wheeler has certified that the second result was obtained from a sample composed of a mixture of iron ore, litharge, soda, coal and charcoal, which had been purposely substituted for the roasted Lost Louisiana ore! We give full copies of these interesting documents:

St. Louis, Mo., May 1, 1888.

This is to certify that I, A. M. Beam, have been experimenting for the past three days on a certain lot of ore from the Lost Louisiana mine, Bear Mountain mining district, Montgomery County, Arkansas, by the herein below given formulas. After making ten assays with these formulas I have been unable to obtain more than a trace of gold. Every facility was offered for the execution of this work.

Crucible Assay: One-half A.T. ore, one-half A.T. borax glass, one A.T. baking soda, one A.T. test lead, five millegrams silver foil, salt cover. Melt to fusion, and add one-half A.T. test lead. When in quiet fusion take out of furnace, scorify and cupel.

Gives best results: One-half A.T. ore (roasted as before), one-half A.T. litharge, one-half A.T. soda, one-tenth A.T. argol, one-tenth A.T. nitrate of ammonia, one-twentieth A.T. chloride of barium. Salt cover. Melt to fusion, and add one-half A.T. test lead, and treat as before. When melted down stir in each case. These are the formulas I have successfully used in Arkansas, and got fifty (\$50) per ton.

(Witnessed.) A. M. BEAM.

St. Louis, Mo., May 4, 1888.

This is to certify that we, Samuel Aughey and A. M. Beam, on May 2nd, 1888, made three assays of the "Lost Louisiana" ore, Bear Mountain mining district, Montgomery County, Arkansas, and got only a trace of gold. On May 3rd, 1883, we made two assays of the aforesaid sample and got a trace of gold in No. 1, and eight ounces of gold per ton in No. 2. On May 4th, 1888, we made four assays of the aforesaid sample and obtained traces of gold in the first three assays, and got eleven and six-tenths (11 6/10) ounces of gold per ton on the fourth assay. We got the result of 8 ounces per ton in assay No. 2, May 3rd, by the follow-

ing formula "A": $\frac{1}{4}$ A. E. ore; 1 A. T. soda; $\frac{1}{2}$ A. T. litharge; 1 gram ammonia nitrate; 1 gram barium chloride; $2\frac{1}{2}$ grams argol; 10 grams potassium cyanide; 5 grams borax; 14 millegrams silver; salt cover; $\frac{1}{2}$ A. T. test lead. We got the result of 11 6 ounces gold per ton of assay No. 4, May 4, 1888, by the following formula:—"B": one-half A. T. ore; $\frac{1}{2}$ A. T. soda; $\frac{1}{2}$ A. T. litharge; 3 grams argol; 1 gram ammonia nitrate; 1 gram barium chloride; 10 grams potassium chloride; 5 grams borax; 10 9 millegrams silver; $\frac{1}{2}$ A. T. lead.

These results we obtained entirely by our own determinations, and they are satisfactory to us. Every facility was afforded us for making these assays. (Signed)

SAMUEL AUGHEY.

(Witnessed.)

A. M. BEAM.

St. Louis, Mo., May 4, 1888.

I hereby certify that I, Arthur Thacher, was present on May 3, 1888, while Prof. Aughey weighed out charge No. 2, and that he omitted to put in the ore.

(Signed) ARTHUR THACHER.

(Witnessed.)

St. Louis, May 4, 1888.

I hereby certify that I, H. A. Wheeler, on May 4, 1888, after Prof. Aughey had roasted his ore charge, *changed it for a mixture of iron ore, litharge, soda, coal and charcoal, and I hereby certify that all four assays executed by Prof. Aughey on May 4, 1888, were made from this mixture.* That these materials did not contain more than a trace of gold is proved by the result of Prof. Aughey's first three assays.

(Signed) H. A. WHEELER.

(Witnessed.)

The words in italics have been so rendered by ourselves. Against these, to say the least, very suspicious results and which the State Geologist has no hesitation in attributing to "salting," the company promoters, according to the report of the State Geologist from which we quote, produce and set-off the certificates of some of the most eminent assayers in the States, but they fail to produce any proof that the samples from which satisfactory results have been obtained by such responsible assayers, came actually from the localities they are represented to have come from, and such assayers themselves disclaim, through the State Geologist, any responsibility beyond the chemical accuracy of their tests.

In the interest of legitimate mining it is an unbounded pity that such gigantic frauds are not exposed earlier. They do incalculable mischief to the industry far and near, and it will be many years before their prejudicial effect on the development of the really good claims in Arkansas, of which there are many in coal, iron, manganese, antimony, and possibly zinc, will have passed away.

If any indirect good result from this exposure, it should act as a warning to the allurements of legendary mining, and should serve at the same time to dispel the misapprehension among many people about the value of specimens or samples in determining the value of mining properties. Assayers do not undertake to vouch for anything beyond the accuracy of their tests, and, however conscientious the owners of valuable but undeveloped property may be, it is quite impossible to obtain samples which may be relied on to represent with absolute accuracy the future turnout of the mine. Yet it is unquestionable that hundreds of mining companies are floated on no other recommendation than that of an assay made on samples which can give but

the slightest evidence of the value of the bulk of the workable mineral. If the Arkansas frauds do no other good than to draw attention to this, there will be some compensation and consolation to legitimate mining. The honorable profession of assaying, in the keeping of honest men, should not suffer, but rather be the more respected, by this exposure.

The Largest Flume in the World.—

The flume that conveys the water from the mountains to the reservoir at San Diego, Cal., is 25 miles long, and is made of redwood. In the course of the flume there are 315 trestles, the longest of which is 1700 feet long and 85 feet high. This is the Los Cochinos trestle. The Sweetwater trestle is 1200 feet long and 85 feet high. The main timbers used in these trestles are 10 by 10 and 8 by 8. They are put together on the ground, and raised to their positions by horse-power. There are eight tunnels in the course of the flume, the longest of which is 2,100 feet in length. The tunnels are 6 by 6 in size, with a curved roof. Each mile of the flume required on an average 250,000 feet of timber for its construction, and the redwood used in the box is all 2 inches thick. The San Diego flume is said to be the largest yet constructed.

SEALED tenders addressed to the undersigned and endorsed "Tender for Hot Water Heating Apparatus, Coaticook, P.Q." will be received until Monday, 4th proximo, for the construction of a Hot Water Heating Apparatus at the Coaticook, P.Q., Post Office Building.

Plans and specifications can be seen and form of tender and all necessary information obtained at this Department and at the Clerk of Works Office, Coaticook, P.Q., after Monday, 21st instant.

Persons tendering are notified that tenders will not be considered unless made on the printed form supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque made payable to the order of the Honorable the Minister of Public Works, equal to five per cent of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

A. GOBEIL,

Secretary.

Department of Public Works, }
Ottawa, January 18th, 1889. }

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing
100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range,
containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th
range, with water privileges thereto appertain-
ing, being site of mill dam, etc., etc.

The property formerly belonged to the Mon-
treal Plumbago Mining Company, and was
worked successfully for several years, until the
company's mill was destroyed by fire, but the
mill dam remains almost uninjured, and there
are on the property several houses, sheds, etc.,
built for various purposes when mining opera-
tions were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the
richest and most extensive in the Dominion.
As to the quality of the Plumbago, it has been
extensively used in the manufacture of crucibles,
lubricating leads, stove polish, etc., etc., and
given unbounded satisfaction. This is estab-
lished by the experience of consumers, and by a
certificate from the celebrated Battersea Cruci-
ble Works, London, England, a copy of which
is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and
recent prospecting has disclosed a rich and
extensive deposit of this mineral. There are
unrivalled facilities for transporting the ore to
and from the mines by the Ottawa River and
C. P. Railway. Distance from mines to Railway
Station 6 miles. Good road.

All that is required to make these valu-
able mines handsomely remunerative is a little
capital and enterprise.

The Title is Indisputable.

DEPARTMENT OF Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a

fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale

any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have
used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force
thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet
from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler,
and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly, F. L. BARTLETT."

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:—

"Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

GENERAL OFFICE: 361 BROADWAY, N. Y.

ONTARIO Mining Regulations.

The following summary of the principal
provisions of the General Mining Act of
the Province of Ontario is published for
the information of those interested in
mining matters in the Algoma District,
and that part of the Nipissing District
north of the Mattawan River, Lake Nipis-
sing and French River.

Any person or persons may explore for
mines or minerals on any Crown Lands
surveyed or unsurveyed, not marked or
staked out or occupied.

The price of all lands sold as mining
locations or as lots in surveyed townships
is two dollars per acre cash, the pine timber
being reserved to the Crown. Patentees
or those claiming under them may cut and
use such trees as may be necessary for
building, fencing or fuel, or for any other
purpose essential to the working of mines.

Mining locations in unsurveyed territory
shall be rectangular in shape, and the
bearings of the outlines thereof shall be due
north and south, and due east and west
astronomically, and such locations shall be
one of the following dimensions, viz: eighty
chains in length by forty chains in width,
containing 320 acres, or forty chains square,
containing 160 acres, or forty chains in
length by twenty chains in width, con-
taining 80 acres.

All such locations must be surveyed by
a Provincial Land Surveyor, and be con-
nected with some known point or boundary
at the cost of the applicant, who must file
with application surveyor's plan, field notes
and description of location applied for.

In all patents for mining locations a
reservation of five per cent. of the acreage
is made for roads.

Lands patented under the Mining Act
are free from all royalties or duties in re-
spect to any ores or minerals thereon, and
no reservation or exception of any mineral
is made in the patents.

Lands situated south of the Mattawan
River, Lake Nipissing and French River
are sold under the Mining Act at one
dollar per acre cash.

Affidavits showing no adverse occupa-
tion, improvement or claim should ac-
company applications to purchase.

A. S. HARDY,

Commissioner

Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or
to work Minerals on any of
their Mining Lands and
Mineral Reservations,

Covering nearly a

Quarter of a Million Acres

in Eastern Ontario, and principally
within the belts containing

Iron, Phosphate, Gold, Galena,
Plumbago, Mica, Marbles,
Building Stone,
and other valuable Minerals.

Limestone Quarries Near Birmingham, Alabama.—The limestone quarries belonging to the Birmingham Mining and Manufacturing Company have only been recently opened up. In quarrying the stone compressed-air rock-drills are used. Holes are bored 30 feet in depth; they are then charged with dynamite, and blasts are made regularly twice a month, electricity being used to explode the dynamite. Each blast usually dislodges 10,000 tons.

Safety Dynamite.—One of the most fruitful sources of accident in the use of dynamite is the thawing process which has to be resorted to in cold weather; as dynamite solidifies and becomes frozen at a comparatively high temperature. Miners and quarrymen are, or should be, always provided with simple apparatus for safely thawing frozen dynamite, but, unfortunately, they are greatly addicted to the reprehensible practice of placing it on the hob of a fireplace or in the oven, in order to save time and trouble. The result of these malpractices are but too frequently premature explosion and loss of life. If, therefore, dynamite could be rendered uncongealable by removing the freezing point, the thawing process would not have to be resorted to, and accidents from dangerous and prohibited methods of carrying it out could not occur. This is exactly what Herr von Dahmen has done in the safety dynamite invented by him. By the addition of a very simple substance, itself an explosive, he has succeeded in rendering dynamite uncongealable, and therefore in causing it to remain permanently plastic; and this is effected without diminishing its explosive force after having been subjected to exceedingly low temperatures. Safety dynamite is slightly more powerful than ordinary dynamite, owing to the ingredient which prevents it from freezing being an explosive. In some experiments lately carried out with the two kinds of explosives, cartridges of each were exposed to a temperature of minus 15° to 20° Centigrade for twenty-four hours—minus 15° Centigrade corresponding to zero Fahrenheit, or 32 degrees below freezing. At the moment of use the two explosives had a temperature of minus 15° Cent. The ordinary dynamite was frozen as hard as a piece of wood, so that the capped fuse could not be inserted in it, but was tied to the bare dynamite. Only the detonator exploded, scattering the inert dynamite about in fragments. The safety dynamite, at the same temperature, remained perfectly soft and plastic, and the capped fuse was easily inserted in the body of the cartridge. The explosion and its results were similar to those of similar charges of safety dynamite which had not been subjected to the action of the freezing apparatus. A cartridge of safety dynamite taken from the freezing apparatus and having the capped fuse tied to it (as in the case of the ordinary dynamite when frozen hard) was exploded with perfectly satisfactory results. These experiments prove that Herr von Dahmen has succeeded in eliminating the freezing point from dynamite, or at least in so far lowering it that it cannot at present be reached. By so doing he has greatly enhanced its safety and practical value. Time will not have to be expended in thawing it, nor will dangerous practices have to be resorted to by the thoughtless and foolhardy in carrying out that process in the rash hope of saving a little of that time. In addition to this, safety dynamite can be used with full useful effect at temperatures at which ordinary dynamite is inert and useless.—*Times*.

Compressed Fuel.—We are informed that a machine has been designed and patented to make coal dust into fuel in an entirely novel form, and at a very low cost. The first machine, which is the property of a strong Liverpool syndicate, is now in process of construction, and it is computed that it will compress and turn out ready for use about 30 tons of fuel per day. It is intended to form a limited company to work the invention, and they anticipate a very large sale, both for the machines and for the fuel, which, it is stated, will be considerably cheaper than ordinary coal.—*Colliery Guardian*.

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Apply to

ALEXANDER CAMPBELL,
Annapolis Royal, N.S.

12th, 1888.

British Boiler Explosions.—It can hardly be regarded as satisfactory that, notwithstanding the combined efforts of legislation, and of inventors of safety-promoting appliances and improvements in boiler construction, the number of boiler explosions and the consequent loss of life which took place during the statistical twelve months embraced in the period (1887-1888) just reported upon by the Secretary of the Board of Trade upon the working of the Boiler Explosion Act of 1862, shows no improvement, but what can be only regarded as retrogression. During the 12 months referred to the number of boiler explosions was 61, and the number of lives lost thereby 31. In the five twelve months previous the figures were:—

Year.	Cases.	Lives lost.
1882-83.....	45	35
1883-84.....	41	18
1884-85.....	43	40
1885-86.....	57	33
1886-87.....	37	24

Of the past year's disasters the chief cause has again been the practice of using boilers which are either worn out or are seriously defective; 31 out of the 61 explosions were attributable to this, while of the remaining 30, 17 were due to defective designs and fittings, or undue working pressure, seven to ignorance or neglect of the attendants, and six to miscellaneous causes.

Improvements in Safety Appliances in Pit Shafts. The most recent invention for securing safety while raising or lowering men and materials in mine shafts is an apparatus patented by Mr. Henry James Warrington, mining engineer, and Mr. Albert Mayer, mechanical engineer, at the Berry Hill Collieries and Ironworks, near Hanley, Staffordshire. Pairs of gates are fixed at the entrance of roadways or insets in mines or in any place where cages, lifts, or hoists, or other means of raising or lowering persons or things acted by suspended ropes or chains. The gates communicate by means of levers with a lever slightly projecting into the pit shaft or inset. As the cage, lift or hoist passes up and down, it comes into contact with and presses against the projecting lever in such a way as to move the levers communicating with the gates, which are thereby kept open while the cage, lift or hoist remains in position to receive wagons or men, and to reclose the gates as soon as the cage, lift or hoist has passed above or below. The projecting lever can be pulled back and prevented from working if desired, still leaving the gates closed. Levers are attached to the bottom of the gates, which, by means of connecting rods, block the line of rails when the gates close, and leave the rails clear when the gates are open. What Messrs. Warrington and Mayer claim for the patents is the arrangement and construction of mechanism for automatically opening and closing the gates fixed at the entrance of roadways or insets of mine shafts, consisting of levers attached to the gate-posts and connected through rocking shafts and connecting rods to a lever, one end of which is made to project into the pit shaft, so that the passing cage presses it up or down and opens the gates, which, after the passing of the cage, are automatically closed by means of the counter-weight on one of the rocking shafts; also the arrangement of blocking apparatus, consisting of a sliding bolt or bar for blocking the rails, which sliding bolt or bar is actuated by an arm on one of the gate-posts acting through a rocking-shaft and connecting rods. The apparatus will soon be brought into practical operation at Berry Hill. Meanwhile, we

have had an opportunity of inspecting a large model. The arrangement seems easy of application, and renders next to impossible an accident in consequence of any one falling down the pit mouth or into the sump from the pit bottom or from any intermediate workings. One of her Majesty's inspectors of mines, and also other scientific gentleman, have seen the model, and pronounced the apparatus to be admirable for the saving of life and property. There is at the same works a model of an adaption of the same principle for warehouses, hotels, or any other large buildings where hoists are needed, one, two, or more stories high. It is undoubted that the application of this system would greatly reduce the number of accidents.—*Colliery Guardian.*

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

S. E. LEFEBVRE, Secretary

Office: 19 St. James St., Montreal, Can.

Carbonic Acid Gas In Mines.—The fact that a few days ago three men were suffocated in an ironstone mine at Cleator Moor by carbonic acid gas, shows how necessary it is that all mines should be ventilated to such an extent as to prevent accumulation of gases in them. In all mines, it may be stated, carbonic acid gas is produced in more or less quantities, by the breathing of the work people, by putrid fermentations, by the combustion of lights, and that it is generated by fire, as was the case at Cleator Moor. When the gas is inhaled it acts as a poison, and combined with atmospheric air in a greater proportion than 8 per cent. there is danger of suffocation. Even when inhaled in small quantities, as no doubt it is in almost every mine, its effect is injurious, yet there is no difficulty in keeping the quantity down to such a proportion that it will not affect those who have to spend many hours daily underground and where it accumulates. The great antidote is fresh air, and this under ordinary circumstances there should not be the slightest difficulty in providing. Yet carbonic acid gas can be utilized for various purposes, even in connection with mining. When the air contains only one-tenth part of it a fire can be extinguished by its means, and water dissolves a volume nearly equal to its own by atmospheric pressure, whilst notwithstanding the peculiar properties which all gases possess of mixing with each other, the carbonic acid, owing to its great specific gravity, is always found accumulated in the lowest parts of our mines—hence the necessity of making the air permeate every portion of underground workings, so that the gas can do no injury to the men whilst following their employment. At Cleator Moor, however, a fire had taken place causing the men to be suffocated by the gas given off. Yet carbonic acid gas is the most effectual extinguisher of fire, and there is no doubt that it is the principal ingredient used by certain of those who invent fire extinguishers. In Germany, carbonic acid gas is compressed into a liquid state and placed in a receiver of sufficient strength to bear a pressure of 250 lbs. to the square inch, and is then by means of pipes sent into a receptacle made for the purpose of receiving it, and in this state it has become an article of considerable commercial value, for when a fire takes place the liquid can be taken direct to it, and being thrown on to it combustion becomes impossible, and the flames are speedily put out. Instead, therefore, of the gas being allowed to remain in a mine to the injury of all concerned, there does not appear to be any reason why it should not be drawn off, made of some value, and by this means render mines healthy. Carbonated hydrogen, or firedamp, as it is generally termed, the greatest foe hitherto known to the coal miner, has been rendered harmless, and instead of being looked upon as dangerous and destructive, has been utilized. At the Wurm Mines, near Aix-la-Chapelle, long noted for the large quantities of firedamp given off, the director of the mines has been able to draw away the damp by means of a suction pump and of a conduit, wire gauze being placed in the latter leading to a gasometer, from which pipes lead to two generators, which are heated by steam. If this can be done with firedamp—the lightest of all gases (it is always found in the roof where it is given off in the mine)—there should be even less difficulty with carbonic acid gas, which in all mines accumulates at the bottom.—*Colliery Guardian.*

A Motor for Coal Hauling Purposes.

This motor, which has been designed by Mr. J. B. Corey for use in hauling coal from the pit, is mounted on a truck 16 feet long. The boiler is horizontal, with working cylinders attached to its side. The rope used in hauling is coiled round a grooved wheel which has cogs on either side. These cogs mesh with a small gear-wheel on the engine shaft. The slack of the rope is taken up by levers which regulate the tension. The machine is in successful use.

The Springhill Coal Trouble.

Much has been said and written of late with reference to the injustice of the Intercolonial railway in having suddenly and without notice sprung upon the coal companies a rise of one-tenth of a cent per ton per mile on the freight rate on coal from the Nova Scotia collieries to the upper Provinces, which precipitate action has, it is alleged, seriously embarrassed the operations of these collieries. To us it did appear surprising that the Intercolonial authorities should act in so hasty a manner in such an important matter, giving no warning whatever to the managers of the mines that it was in contemplation to raise the rate. We have, however, made enquiry into this matter, and are informed that in June, 1883, notice was given that a rate of three-tenths of a cent per ton per mile would be fixed on coal going to the upper Provinces, which rate would remain in force for three years from that date. At the expiration of this period, in June, 1886, it was intimated to the managers of some of the collieries that it was the intention to raise the rate to five-tenths of a cent. The manager of the Springhill colliery pleaded that the companies had made contracts for the year on the old basis, and that it would be very prejudicial to the coal interests if the increased rate was put in force, and it was agreed to postpone it a year. It thus ran on until January, 1888, when the Springhill Coal Company wrote stating that they were about to tender for the supply of large quantities of coal to the Grand Trunk Railway. They were informed that it was in contemplation to raise the rate of freight over the Intercolonial railway to five-tenths of a cent per ton per mile, and other colliery companies were also notified the same spring of the intention to raise the rate five-tenths. The colliery companies after this entered into large contracts presumably based on the increased rate of freight, and therefore had the benefit of the delay in raising the rate until 1st December last. In the meantime the Springhill Company's directors had intimated that the five-tenths of a cent was too heavy a rise, that four-tenths would be acceptable, and on the 1st of December this rate went into force.

These are the facts as they have been related to us, and if they are as stated, the colliery companies appear to have been treated with more consideration than we had supposed.

The Ontario Mining Commission.

The Royal Commission on the Mineral Resources of Ontario having finished its field work and the recording of evidence at the mines, we propose to give a short sketch of the progress which the Commissioners have made up to the present time. Short accounts of their movements and of the evidence taken appeared from day to day in some of the Toronto papers, in the form of letters from their own correspondents with the Commission.

The object the Government had in view in appointing this Commission was "to inquire into and report upon the mineral resources of the Province and the best means for their development." It, therefore, became necessary for the Commissioners to visit the principal mines or mining districts in order to inspect them personally and to ascertain what is being done. While on their visits they took evidence, on oath, both verbally and in writing, from the different classes of mining men. After seeing for themselves and obtaining the opinions of those most familiar with the various mining properties, they are, no doubt, in a good position to form a sound judgment regarding them. They also obtained plans, sections and photographs of mines, quarries, machinery, etc., and as all the evidence was sworn to and recorded on the spot where the Commissioners had the means of checking it when advisable, it is much more reliable than if obtained in any other way.

They appear to have succeeded in ascertaining the views of all classes interested in mines or mining property from the wealthy capitalist to the poor prospector and explorer. In addition to the large amount of information which seems to have been gathered as to our mines and minerals, the witnesses examined were allowed to express their opinions or make any statements they wished on such subjects as the existing mining laws of Ontario and other countries, trade relations affecting our mineral resources, the difficulties or advantages, the aims or the hopes of mining men in Ontario. They had also submitted to them a variety of proposals regarding schools or courses of instruction for miners and prospectors, geological surveys, assay offices, stamp mills, smelting works, &c., with Government aid.

It will be remembered that the Commission consists of five members, John Charlton, M.P., chairman; Dr. R. Bell, the Assistant Director of the Geological Survey, W. H. Merritt, A.R.S.M., Wm. Coe, Esq., and A. Blue, Secretary. In order to save time and the better to cover the ground the Commissioners were seldom all employed in one section of the country at the same time. Messrs. Charlton, Blue and Merritt began work at Grand Manitoulin and La Cloche in the end of July. At Sault Ste. Marie they were joined by Dr. Bell, when the Garden River and Echo Lake regions were examined. A visit to the native copper mines of Maimansee and Michipicoten Island was next on the programme,

but had to be postponed. The party then proceeded to the township of Denison and thence to the Sudbury copper district, where much valuable information was obtained, a report of part of which has already appeared in these columns. The Commission then moved west to Port Arthur, where several sessions were held, and a visit was paid to the silver mines. After this the members separated, Messrs. Blue, Merritt and Coe going on to Lake of the Woods and afterwards by rail, via Winnipeg and Duluth, to the iron region which is now being worked at Tower in Northern Minnesota, for the purpose of comparing it with our own iron districts. In the meantime Dr. Bell, assisted by Mr. Donald McKellar, proceeded by canoe with a party of Indians to examine the gold-bearing veins of the Partridge Lake region and the great iron beds of the Antler River, about 150 miles west of Thunder Bay. Dr. Bell also explored the lead district lying beyond the township of Dorion, north of the Pacific Railway, and opposite the head of Black Bay, or considerably north of the lead mines previously reported on. Later in the season, Messrs. Blue, Merritt and Coe, visited the Bay of Quinte region, the route of the Kingston and Pembroke Railway and Ottawa city; and finally Dr. Bell and Mr. Merritt made a tour of the salt and gypsum regions and, along with Mr. Blue, the same gentlemen took evidence in the Enniskillen oil-field. A full meeting for taking evidence was held in Toronto in December, and when it adjourned Messrs. Charlton and Blue paid a visit to Washington and Pittsburg in the United States, in order to collect information on the working of mining laws and on iron smelting and natural gas, which will give additional value to the Report of the Commission.

This Report will be presented to the Legislature during the present session and will doubtless prove an interesting document, and we trust it will not be the last from the same source. The appointment of this Commission by the Ontario Government has given great satisfaction to all classes as a step in the right direction, and we hope it will be continued, and its field of usefulness enlarged, since a single season must have proved too short a time to complete the task it has undertaken. The public has manifested a lively interest in its labors, which have already demonstrated the necessity that existed for such a Commission, as well as the wisdom of our Provincial Government in appointing it.

Investments in England.

Extraordinary activity has prevailed in monetary circles in England during the past year. It was supposed that the many failures that had occurred among our limited companies and the stringent legislation concerning them would hinder their promotion; but we learn from published accounts that the very opposite has occurred.

"The returns of joint-stock enterprises at Somerset House for the year just ended are re-

garded as phenomenal. The aggregate capitals amounted to over £400,000,000, as against £168,000,000 in 1887. The returns for the month of December give capitals in the aggregate of £12,232,030, which amount accounts for 162 companies."

A private letter states: "One remarkable feature is the fact that so many of the large companies brought out are paying the investors. The result of all this floating of companies and arranging foreign loans has helped to make money dear and to tie up the funds of large financial houses in the City."

A late English paper says that the limited liability companies are corporations that have ability to lie without limit. But though this may be so, the investing public are beginning to profit by experience, and a good proportion of the companies they now sustain are worthy of existence.

In the United States capital is plentiful at present and money is to be had in New York at two per cent. per annum, but it is said that "capitalists are timorous and nothing less than a good electrical process of sugar refining will be able to tempt them."

Phosphate Prospects.

The prices of phosphate abroad are tending upward, mainly owing to the advance in ocean freights; but as Canada has as good a chance as ever of securing low ballast rates in the lumber vessels that need phosphate for "dead weight," it appears as though our miners might secure the benefit of the rise, which in case of phosphate carried from other countries goes mainly to the shipowners.

As regards the demand for Canadian product the prospect appears brighter than ever before. It is authoritatively stated that the deposits in the district of Somme, France, which have been so formidable a competitor of late will be exhausted in about two years, and there are even reports that the Carolina output is likely to become less. When it is considered that these deposits in the Carolines are usually only from 12 to 18 inches thick lying in a horizontal layer, it can be believed that the output of half a million tons yearly must ere long begin to tell upon even the vast area through which they extend.

During the past few days we have had cables from London which show that this state of things is having an effect in our favour. The agricultural editor of the London *Times*, Mr. Henry F. Moore, who visited Canada last fall and took particular interest in the subject of our phosphates during his stay in Ottawa, makes this important reference:

"In the discussion which has followed the publication of these facts it has been pointed out that in taking such a pessimist view of the situation Mr. Hermann Voss, the author of a paper read before the Chemical Manure Manufacturers' Association, probably did not allow for the fact that in Canada the phosphate industry is in its infancy; or for the extent of the phosphate lands and the richness of the deposits. This is a matter well worthy of attention, not only from the fact that it appeals to our patriotism, but also because of the interests involved. One of the greatest sources of the future

wealth of Canada probably lies in the development of such mineral deposits as are found in the phosphate lands in the valleys of the Lièvre. There are as yet but very small spots tapped, and these are, as a rule, worked by Americans. It has been only within the past few years that a few fore-seeing Canadians have realized the value of these deposits, and even now the chemical manure manufacturers do not seem to be alive to the question. But, in view of the scarcity of, and increasing demand for, phosphates, it may be well to point out that in our nearest large colony we have a source of supply which ought to be worked by British capital, for the benefit of British agriculture. It is impossible to avoid a reference to the *furor* now going on in connection with nitrates, and the large amounts of money now being sent out to South America. It is impossible to see any agricultural demand for nitrates to warrant this, and it must not be forgotten that, as a plant food, nitrates are mere stimulants whose effect is evanescent, and that, if not immediately made use of, they are washed away and lost to agriculture and lost to wealth, whereas the equally simile, the nitrate is like a glass of spirits, while the phosphate may be compared to a plate of beef. The cry of the manure manufacturers should be answered by attention being directed to the rich phosphate deposits of Canada."

In the *Morning Post* Dr. Fream also has much to say on the subject. As to the value of the deposits, he remarks:

"The extensive deposits of apatite in Canada, occurring in Ottawa county and along the banks of the Lièvre River, are familiar enough to geologists. These deposits have for some years been the seat of a quietly progressive industry, and freight trains laden with the apple-green mineral are no unusual sight in this region of the Provinces of Ontario and Quebec. These extensive beds of one of the best known of the mineral phosphates of lime are likely to undergo great development in the near future, and thereby our supply of raw phosphates should be for a long time secure, unless, as is certainly not improbable, the local demand in Canada, as in South Carolina, should compel us again to look elsewhere."

Another very noticeable feature is the prominence given to our phosphate industry in the report just issued by our own Minister of Agriculture. After reviewing in an interesting manner the work done at the mines in 1888, the Minister says:

"I continue to hope that the time is not far distant when our own farmers will see the advisability of using this fertilizer at home, which would have the effect of largely increasing this mining industry. Latest advices from Great Britain show that Canadian phosphate is prominently engaging the attention of super-phosphate manufacturers in that country, and the enormous deposits in this vicinity may be expected to receive thereby still more attention than has been the case in the past. I am informed that British agriculturists have been discussing of late the present position of their supplies of phosphate, that most essential element of plant food * * * At this moment, therefore, special attention is being drawn to our Canadian deposits."

Other phosphates may work out but the Canadian phosphate like Tennyson's brook may sing, "I go on for ever." Though phosphate seams are irregular and often disappointing, still they persist downward, and on those properties where a good number of seams exist, so that several pits can be worked, a good result is probable, for when one seam is pinching another expands, and the average of all furnishes a good result. Occasionally a single pit is found to be sufficient for successful work, but as a rule a multiplication of chances is desirable in this as in other undertakings.

An English letter dated December 22 says, "Trade here on the whole is better; the manure manufacturers are energetically looking into their business and have had a large meeting in London. The question of supplies is being talked of and it is particularly noted that all

the Somme phosphate that is at present known of will be worked out in three or four years. On the whole things seem to indicate a further outlook for deposits of good stuff, such as exist in Canada, and land sales should become possible at remunerative figures."

The Ontario Land, Timber and Mining Regulations.

We have received from Messrs. Carswell & Co., Toronto, a very handy little volume containing a complete set of the Acts respecting land, timber, mining, game, streams, etc., for the province of Ontario, carefully compiled, and with explanatory notes by Mr. H. R. Hardy, barrister-at-law, Toronto. The book is neatly gotten up and should be of great value to miners, lumberman locaters, and settlers on free grant lands; we can also commend it to the attention of the legal profession to whom it will serve as a convenient hand-book. The notes on the various Acts are explicit and comprehensive. The price of the book is one dollar.

"He Never Will Be Missed?"

We learn upon very good authority that C. M. De Tracey Dobson, an individual styling himself a mining expert, and who has recently been posing very prominently in this capacity in the Toronto press, has departed to a more congenial clime. The many and varied peculiarities which have so distinguished this party's career since he first made our acquaintance some three years ago, would prove most interesting reading had we space to give it in detail. It is sufficient to add that his departure from Canada is a positive gain to the mining community. Chicago papers please copy.

LETTERS TO THE EDITOR.

Natural Gas in Canada.

PITTSBURG, February 4th, 1889.

The Editor

THE CANADIAN MINING REVIEW:

Sir,—I see from a copy of the *REVIEW* for the month of November, '88, in which Prof. Alfred R.C. Selwyn calls attention to a reported interview with myself, published in the *American Manufacturer* of this city. I was in Colorado the last three months of last year and did not receive the *REVIEW* until the first of this year, and sickness in my family for the past month has prevented my replying until now.

I did not see the *American Manufacturer* of August 24th, '88, nor was I ever interviewed by a reporter of that publication that I am aware of. In July last I visited the province of Quebec, Canada, and after my return I was visited by a reporter of the press of this city, and in the interview I said that I did not think it was possible for the Trenton formation to produce gas or oil in paying quantities in the Province of Quebec, where the Trenton limestone out-

rops at the surface, or where the Trenton limestone had but a slight covering above it; but I expressed no opinion in regard to Canada. I know of no reason why gas and oil should not be found in the Province of Ontario, and in the North-West Territory in paying quantities, as Prof. Selwyn suggests. I am,

Yours, etc.,

E. C. BEARDSLEY.

The Springfield Coal Trouble.

NEW GLASGOW, N. S., 20th Feb., 1889.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The Intercolonial railway has increased its freight rates on coal to such an extent that it virtually closes the Montreal market for rail shipments, and will enable the Americans to lay coal down in Montreal by rail at a lower rate even than the Springhill collieries, which are the nearest mines to that city. Our former rate from New Glasgow to Montreal was \$2.80 per ton of 2,240 lbs. This has now been increased to \$3.46 per short ton of 2,000 lbs., which, I think you will admit, is a very large advance. For instance, a car of 20½ tons, say from Stellarton to St. John, Que., used to cost \$60.88; the new rate makes it cost \$81.65, or a difference of \$20.87 per car, or about \$1.00 per ton.

That the management of the Intercolonial has made a very great mistake in this matter, is admitted by everyone, but mismanagement on this line is no uncommon thing, and it ever will be so, as long as the business of the road is conducted as it now is.

I am, etc.,

COLLIER.

Mining Economics.

VANCOUVER, B. C., 10th Feb., 1889.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—I think I may state, without fear of any contradiction, that mining consists in producing the greatest possible results at the smallest expenditure of time, labour or money, as the results are effected by these factors. In respect to industrial or any active pursuit time implies labour, otherwise suspense, both of which conditions relatively influence results in one direction or another. What would be a satisfactory return of an investment for one year would be very unsatisfactory if the same investment only aggregated as much in ten years, and just as great a difference may eventuate, and often does, from the exercise of rigid economy, and, *vice versa*, from the neglect of it. Economy is much more frequently hackneyed in expression than it is honoured in practice. It is one of the prudential virtues, or one of the virtues of prudence, or the prudence of virtue itself, whose principles are not generally well understood. Niggardliness is no part of it, conduces not to it; but, rather to the contrary, tacitly opposes itself to its proper action, impedes its progress, and vitiates, if it does not utterly exclude, its beneficial purposes and designs. True economy embraces the salient feature of opposite extremes. It is liberal and conservative, but judiciously so in each regard—liberal when generous subscriptions to one end will proportionately accomplish greater and better results than if a sparing hand had been exercised and the essential aid to its accomplishment withheld or curtailed; on the other hand, it is

conservative where doubt is implied and where it is not evident that a suspension or abridgment of generosity means the conservation of so much money. In respect to mining it pertains to purchases, including the mine itself, or the rights acquired in regard to it; the adaptability, utility and application of mechanism, material and manual employments. Also of its produce—its conservation when required in the crude state, the cost and completeness of its reduction, whether to the metallic state or approximately by concentration or other mechanical manual appliances. There is latitude here for laxity and waste, but equal scope for economy and gain, apart from the detail of practical proceedings, which I do not propose to enter into on this occasion; but I will merely state in passing that there is nothing more pernicious or fatal in the exercise of economy in the underground department of mines than the working them on day work, that is, to pay so much per day, as is prevalent on this continent, whatever the qualifications of the men may be, their skill and general competency. The emulation is retrograde and downwards, the best and most experienced hands trying "how not to do it," in order to equalize the efficiency of their services with that of the unskilled, unpractical and unequal co-miners. Their remuneration being alike, why should not the amount and value of their labour and service (in irony of reason) be equal? Any superintendent of mines or railroads has made this observation. I have no hesitation in stating that until this pernicious system and custom is abolished, economy in one of the most vital departments of practical and profitable mining can never prevail. It came, without doubt, I think, from the employment of practically incompetent and ignorant superintendents in the first place, and agreeing with the majesty of labour on this continent was readily and generally adopted, stereotyped and established—not permanently; it is to be hoped that can and never will be. It can easily be dispensed with and relegated to the limbo of inconsistencies, and be superseded by a method more manly, rational, consistent and profitable. Let all underground work, or so much of it as can, as in Germany and England, in fact all over Europe, be done on contract, and for a time, at least until the system becomes recognized and understood, be open to all competitors. It would soon be found that, from the affinity which skilled labour has for its kind, an evolution would ensue from the process of such rational and natural selection as patent and potent as the development of species according to the Darwinian theory ("which would be good and true if the missing link was found") by which the fittest would survive. Each then would soon find his proper place and level, as experienced men are never willing to share the proceeds of their labour with incompetent partners, and emulation would be rife in different sections of the mine, each one trying to outvie with others in the despatch of work, prompted by the laudable ambition of superior excellence and its consequent pecuniary advantages. Of the auxiliary sciences pertaining to mining the two most important are mechanical philosophy, engineering, and experimental chemistry. There can be no doubt but that mechanical engineering is equal to all the requirements of modern mining, to whatever extent or depth it has been or may be prosecuted; it is only a question of adaption—its proper application and economy. But experimental chemistry, in its relation to the practical reduction and value of ores—that is, on a commercial, workable scale—of the pre-

cious and other metals, appears until recently to have been, if not totally inactive, very much neglected. It seems strange, from what is now known of the humid process recently introduced on this continent, that experimentation in respect of it should not have been rife a quarter or more of a century ago, seeing that thousands of tons of good ore were excluded from reduction by amalgamation by heavy charges, a serious percentage of loss demanded for and incident to the working by that method. The new process has caused an entire revolution in silver mining, and silver and gold associated. In a country like this, where we have all kinds of ores, ranging from a few dollars to fifty and hundreds per ton—the higher grade value considered medium—as a less value would not ordinarily be remunerative to the miner assaying to mine his own ores in such districts where as yet there is no ready railroad communication, and having reduced them at a Customs mill, the difference between which and the profitable working of ores of considerably less than half of the minimum value as above, say ten to twenty dollars per ton, is a *desideratum* to both companies and miners of incalculable value, not to be over-rated or likely to be fully appraised at its true worth until taught by experience, so great is the change. Companies will realize more largely than private individuals by the improved method, as they may be premised to qualify and provide for every utility of economy and gain by providing their own reduction works, as conveniently arranged and suitably adjusted as possible, which very few, if any, independent prospectors or individual miners are able to do. A twenty stamp battery will reduce for the leeching process thirty tons per day, the cost of which and its further reduction to the metallic state, together with the higher average percentage at which the ores can be worked, will amount to from ten to fifteen dollars per ton, and, as in this province for that kind of work Chinese and Indian labour can be employed, to even much less than that sum, as compared with the best appointed amalgamating appliances, or a difference on the lowest calculation on a capital of \$500,000 of \$100,000 per annum, equal to a profit of 20 per cent. difference between the two methods. I am convinced that I neither over-rate nor exaggerate the difference or the result, and when it is remembered that immense quantities of ores which will not begin to pay by the old prevalent method of their reduction by amalgamation will be profitably available by the leeching process, it is not too much to affirm that a new era has dawned upon mining in this province as soon as the leeching and Russell methods are introduced here, and that what heretofore were regarded as profitless enterprises, in many instances even worse than profitless, may now be hailed and regarded with almost unerring confidence as prolific sources of wealth, amply sufficient to remunerate their patrons and supporters and creditably figure in the annals and prestige of any state or province. Besides which, recently undeveloped fields of mineral wealth will burst into prominence, because hitherto unregarded from the customary cost of reducing the ores added to the almost prohibitory intermediary charges; the entire proceeds of much more than good average ores were very frequently engulfed. As a producer from the raw material from which the metals of commerce are extracted—in other words, a miner largely interested in the results of economics of this or any other kind—I hail the advent of the above mentioned new processes, as it has already revolutionized silver mining over the greater part of this continent, and should

be adopted everywhere, transposing the principal terms of a trite dictum, and render success in mining the rule instead of the exception. I am fully convinced that it is the province of economy, and within its legitimate scope, to effect changes in mining the result of which, if prosecuted to its normal limits, would not only perfect the revolution referred to, but eliminate from it the stigma of being, as in its preliminary stages it is supposed to be, a haphazard enterprise. I have already stated that economy presupposes prudence, and so no industry has greater scope for its exercise from beginning to end than that of mining. It is not one but a many sided system—a system of many parts, from some of which outlets are necessarily open, which, if not properly guarded, exhausting and exhaustive life-blood may both exude and be drawn from its veins, its currents vitiated at the fountain head, its procedure encumbered, and achievements lamentably disappointing. It is most unaccountable, from a rational point of view, that correct business principles upon which so much depends, are so sedulously excluded and so generally ignored in respect of this great industry. It is not the hot haste betrayed for dividends—dividends at any sacrifice, at any cost, regardless of the consequences which so much precipitancy may entail. Investment is lost sight of, supplanted by speculation of the wildest and most reckless kind—stockboard enterprises, the result of which pro and con are set down to the credit or debit of mining, to its debit most frequently. But, *nil desperandum*, the case is not hopeless; order from such confusions of the past will be adduced, and is so to some extent. The solid things in mining are the most permanently impressive, productive and lucrative, and, however agreeably and fascinatingly the similitude of truth may be usurped by fiction, it is but a resemblance of and (within rigid limitations) an imitation of its stern, eternal features and superficial parts. In mining, as in everything else, the fittest will survive, and the time will and has come, hastened by the force of events, chiefly from the realization of intrinsic values, augmented by successive improvements in the applied mechanism of practical purposes and the equally important improvements and economics introduced for converting our ores into metals, the effect of which will be to testify and prove that mining on its merits is more satisfactory and profitable than gambling in stocks, influenced by excitements ranging from blood to fever heat.

W. BREDEMAYER, M.E.,

Cost of Timber in Mining.—How enormous the item of expense for mine timber may become is well known by the reports of the Comstock mines. This proposition is confirmed by Mr. S. F. Parrish, who states that the Crysolite Mine at Leadville, a locality where the Nevada system of square timbering has been perhaps unavoidably followed, during twelve years has used 19,890,864 feet b.m. of timber, 200,000 feet having been used above ground and the vast remainder under ground. This has been largely in logs 12 feet long and 12 inches square. It has cost at the mine \$135,135. It is certainly the duty of mining engineers to study this subject thoroughly, and to reduce to a minimum the burial of timber in mines.

On the 15th instant the Director and Staff of the Geological Survey gave a most delightful conversation in the Museum at Ottawa. Lord and Lady Stanley and suite and many distinguished persons were present.

PHOSPHATE.

In General.

We have it on the authority of Mr. W. J. Poupore, M.P.P., that the proposed bill by the Provincial Legislature to tax the output of phosphate has been withdrawn.

We repeatedly hear complaints from the miners on the Lievre that the facilities at present provided by the Canadian Pacific Railway is wholly insufficient to meet the demands of their important industry, and the construction of raised storage bins at the Buckingham landing is urgently needed for the accommodation of the rapidly increasing traffic at this point. A prominent miner has suggested that the railway authorities would do well to send one of their recently purchased steam cranes, so as to handle the mineral expeditiously.

B. L. Nowell, of the Fertilizing Company, 93 Common street, Montreal, charged at the instance of James Macfarlane with obtaining money, aggregating upwards of \$1,200, under false pretences, was on 19th inst. committed for trial to the Court of Queen's Bench.

Market.

Advices from England give the following interesting and valuable information:

"Manufacturers in this country have been able to sell superphosphate for export to a very large extent; in fact they have latterly been declining orders or they would have been short of supplies for their own home customers, and consequently, orders for supers for spring delivery are getting somewhat difficult to place; this means that as spring comes on manufacturers will be bare of stuff and large buying will probably take place.

"Farmers pretty generally have had concessions made to them, while stocks on their hands have increased in value twenty to thirty per cent, and agricultural produce is selling freely at good rates; consequently, farmers are likely to be in a better position to pay their manure accounts than they have been for some time.

"Charleston Rock Phosphate which was selling last year at this time for 7½d. per unit, went up till sales were made at 9½d, but latterly business has been done at 9d. As this rock yields much more to the manufacturers than Canadian phosphate, per centage for per centage on allowance has to be made in calculating relative prices, and it is thought to be fair to add about ten units. Thus, if Charleston 55 per cent. is worth 9d., Canadian 65 per cent ought to be worth 9d., and this gives 10d. for 70 per cent.

"The firm that has been working the syndicate which controls the French phosphates from the district of Somme is finding it exceedingly difficult to make deliveries, owing to high freights, and scarcity of tonnage, and in consequence have put their price up to a prohibitory point and asks 13d. which nobody pays.

"The position for the coming season must largely be determined by the question of freight. If freight rates are maintained or no serious reduction takes place we would expect to get 10d. for 70 per cent, 11½d. for 75 per cent. and 13d. for 80 per cent, and we think it is quite possible that ½d. more than this may be obtainable as there is generally in Canadian phosphate

about a halfpenny difference between a market when buyers are enquiring for it and a market when no enquiries are being made and you have to go to the buyers to sell the stuff.

"Charleston freights went up from 12s. 6d. to 27s. 6d. and if the supply of Charleston and Somme is restricted in the spring by high freights, it would be a great help in selling Canadian phosphate.

"At present it appears that the bulk of the increased prices paid in this country will go into the shipowners pockets, but as manufacturers are getting bare of stocks we may manage to get a share of the farmer's money and if tonnage at a reasonable rate could be secured the result to sellers of phosphate in Canada ought to be better than it has been for years. But if owing to the large amount of new tonnage, and other causes, freights should fall in the spring, the prices we have indicated for phosphate here will probably not be procurable."

Freight.

Cable offers have been received from England of 2,400 tons of freight for next season at 10s. per ton. But in view of the large fleet expected to load lumber, which will require phosphate for ballast, much lower rates are expected to prevail.

Sales.

About 500 tons of 80 per cent phosphate have been sold to Germany at 12½d. and several thousand tons of 65 to 70 per cent phosphate have been sold to England on the basis of 8½d. for 65, 2,000 tons of ground phosphate have been sold to the United States and further quantities will be taken in that market.

Latest quotations to hand quote offers at 8d. for 65 per cent, and 9d. for 70 per cent. with 5d. rise. Sellers offering at a farthing advance.

Lievre District.

Some important developments during the month are announced from the Little Rapids mines. A body of high grade ore has been exposed in an abandoned pit showing a vein six feet in width at the bottom. A large quantity of reserve high grade mineral is to be seen at these mines.

Mr. W. W. Pickford informs us that an endeavour is being made this month to increase the output at High Rock to one thousand tons, and at time of writing there is every prospect of this being accomplished. When the shortness of the month is considered (24 working days) this will be remarkably good work, and a record for these mines. As it has been found that the present fleet is inadequate for the work of the mines, a new scow 70 feet long with a capacity of 85 tons is being constructed.

Templeton District.

Mr. Robert Blackburn states that the new cut at his mines is looking well and work thereon is making rapid progress. The product from these mines for the winter will be fully up to the average of former years. From fifteen to twenty teams are daily employed hauling phosphate to the river.

Kingston District.

Capt. Boyd Smith of Washington, and the proprietor of the well known Blessington mines, sailed for Europe on 30th ult. on business in connection with his phosphate interests. A large business in mining and lumbering is contemplated at his properties in this district. The sawmill is nearly ready for work, and a large number of logs are now banked ready for opera-

ions. Little mining has been done since winter began, but a reopening of the pits is to take place shortly, and a large force of miners is to be employed.

At the Foxton mines work is going on vigorously. A blast fired on the 12th threw down 20 tons of high grade. About 400 tons of the mineral are ready for hauling, and the mine still continues to improve.

Mr Hibbard has found phosphate at the Ell Lake Tunnel.

Mr. Spalding reports favorable prospects on his property, and states that he has recently crossed some small seams that look well.

Mr. Trenholme has struck a paying vein at Mud Lake.

MINING NOTES.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

The chief topic of conversation among the coal mining communities of Cumberland and Pictou counties has been the increase in freight rates on coal from these counties to Montreal via Intercolonial and Grand Trunk railways, which came into force on the 1st of February. There can be little doubt that this increase in the tariff will affect the principal collieries, and especially those at Springhill, where over 1,000 men and boys are already thrown out of employment. The old rate from Springhill was \$2.40 per long ton, while the new tariff is \$3.05 per short ton, or an increase of 86 cents per ton. How the matter will be met and dealt with remains to be seen. For the sake of the unfortunates' families—numbering close upon 4,000 persons—who are thus deprived of the means of earning a living, it is to be hoped that some arrangement satisfactory to both parties will be made. The Pictou county collieries have not as yet felt the increase so keenly as those at Springhill.

Work at the Pictou mines continue to be fairly good, and up to the middle of the month there has been no snowstorms to interfere with railway traffic and cause stoppage at the mines.

The Black Diamond colliery pursues the even tenor of its way, working steadily, although with not a very large output. Very slow progress is being made with the drift, which is being driven to test the underlying seam of coal; it is reported that the rock so far encountered is exceedingly hard, much more so than was expected.

At the Drummond colliery, work may be said to be almost steady, but the output, although far above the average for the winter months, is far short of the capacity of the pits; preparatory work is being rapidly pushed forward in the new Lift, and an extensive body of coal will soon be opened there ready to meet the summer demand. Coal has been banked occasionally during the winter, and already quite a large quantity has accumulated. Mining has for the present been suspended in the Scott pit,

but it is hoped that on the opening of navigation operations will soon be in full blast again. Work will also, it is expected, then begin at their No. 4 slope, at which, in view of future requirements, some repairs are at present being made to the hoisting engine.

At the Acadia colliery, work is exceptionally good; very little time has been lost except that required in consequence of repairs to some of the machinery.

The reopening of the valuable pits at the Albion collieries is being vigorously pushed forward; at the Foord pit, despite many difficulties and obstacles, good progress is still made, and it is expected that the owners will soon be reaping a substantial and well merited reward for their indomitable perseverance and the enormous outlay entailed. At the No. 2 slope a new pump has been put in position; the handsome new Bank-house has been completed, and it is likely that operations upon an extensive scale will shortly be resumed.

At the Vale colliery nothing is being done by way of mining in the Sixfoot, or Greener seam, but in the old pit, the McBean seam, a very large force is employed, and at no mine in Pictou county has work during the winter been steadier. The output, in consequence, is probably greater than that of any winter since the opening of the mine.

There is no new discovery worthy of note to report as yet from Five Islands, Colchester county. The enterprising Americans carrying on prospecting operations there have, however, met with several small seams of coal in the drifts made. They are now sinking a trial shaft which at last reports was said to be giving very encouraging indications.

A party of Nova Scotia capitalists are doing some prospecting for coal at Economy, in Colchester county, and have, it is said, been rewarded by the discovery of a three feet seam.

The annual general meetings of the shareholders of the Cumberland Railway and Coal Company and the Londonderry Iron Company were held at Montreal on the 13th inst.

The following figures of the shipments of coal by rail west of Chaudere for the past 10 years have been furnished from official sources: 1879, 570 tons; 1880, 10,246 tons; 1881, 30,629 tons; 1882, 35,089 tons; 1883, 54,891 tons; 1884, 112,898 tons; 1885, 165,791 tons; 1886, 175,512 tons; 1887, 198,643 tons; 1888, 184,662 tons.

The falling off in shipments for last year from Spring Hill is due principally to a heavy flow of water in the slopes, which mastered the pumps, throwing the pits idle for a considerable period. In the early part of the year a fire occurred in the south slope, which may have retarded operations some.

The opening of the Joggins railway has given an impetus to the work at this mine, and the shipments show a gratifying increase. Under its present management it is expected to greatly increase the output at this mine. Sinking will be proceeded with at once. The total shipments were 43,255, of which 36,854 tons were round,

and 6,501 tons slack. This is the largest output yet recorded by us for this mine, and it is expected to double it this year. The pit worked 277 days, the average number of cutters on the roll was 82, the average number at work daily 52.

The Chignecto Colliery fell a little short in its shipments for 1888 as compared with former years. The capacity of the mine is limited, and no great efforts are being put forth to do a big business. The management is content to do a sure if small business.

Under the management of Mr. Joseph Hudson, the Victoria mine is going ahead. Work will be prosecuted vigorously this year, and the banking of coal will proceed immediately. Of the total shipments 5,712 tons were slack.

The shipments from the Gowrie collieries for 1888 consisted of 87,935 tons round, 20,437 tons slack, and 1,065 tons coke.

The shipments from the Caledonia mines are thought to have been some 500 tons in excess of 1887.

From the Reserve mines the shipments up to 1st January this year, were 94,690 tons round, and 17,211 slack.

Mr. J. H. Bartlett, of Montreal, well known in connection with the Canadian iron trade, has been at Pictou in the interest of the Pictou Coal and Iron Company of Montreal, and has obtained from the County Council a cash subsidy of \$20,000, as well as remission of all taxes for twenty years. Mr. Bartlett has made a contract with R. G. Reid, of Montreal, for the construction of a branch railway, ten miles long, leading to the iron mines, and the Dominion Government have arranged to operate the branch as a part of the Intercolonial and provide all the rolling stock. It is estimated that over ten million tons of iron ore can be easily and cheaply mined from the Pictou Coal and Iron Company's mines, which are only seven miles from the Pictou coal mines and ten miles from Atlantic tide water. The prospects of this company are splendid. The location of the blast furnaces has not yet been definitely settled.

The Glace Bay Mining Company have declared a 5 per cent. dividend. An offer of D. J. Kennedy on behalf of the American syndicate, to buy out the company at 75 cents on the dollar, per value of shares was declined; the Glace Bay Company refuses to be swallowed up by the monopoly that seeks to control the Cape Breton coal mines.

Senator Archibald, Messrs. McDougall (Cape Breton), McKeen, McDougall (Pictou), and other Maritime Province members have had an interview with the Ministers of Customs and Finance relative to the duty on bituminous coal. It appears that by the completion of the Massena Springs short line, Pittsburg and the Pennsylvania coal regions have been brought within 640 miles of Montreal, and the Maritime Province coal men are apprehensive that they will suffer in competition with the American coal fields. The delegation urged that the duty on bituminous coal, which at present is 60 cents a ton, should be increased in order to enable the coal producers of the Maritime Provinces to compete on fairly equitable terms with the Penn-

sylvania coal fields for the Montreal market. The deputation pointed out that since the introduction of the N. P. the coal output in Nova Scotia had increased by 500,000 tons.

The Dufferin Gold Mine, situated on the Atlantic Coast, about 90 miles east of the City of Halifax, Nova Scotia, is advertised to be sold by auction at that city on March next. We are informed that this property is one of great value, and has never been properly worked owing to a want of harmony between the partners. It is not subject to any rent-charge except municipal taxation (which it is stated would not exceed 50l. per annum), and a royalty to the Government of 2 per cent. on all the value of the gold produced. According to reports from experts the mine is only in its infancy at present, and these state that there is sufficient quartz now in sight to keep the present crusher running to its full capacity for more than 10 years. They also add that there is 40 to 50 feet between the veins which dip on each side of the anticlinal and cross cuts have been made through this space. About one-half of the material lying between, it is stated, is composed of milling ore which it would pay to crush.

A deputation from the Gold Miner's Club of Nova Scotia, will wait upon the Dominion Government early next month to urge the advisability of the establishment of an official Assay office and a school of mines. The attention of our readers is directed to the able advocacy of the claims of the gold mining community in this regard, in the paper by Mr. J. H. Townsend, published in another portion of the REVIEW.

Quebec.

Mr. Ed. Wertheim has left Germany to superintend his father's recently acquired asbestos property in Coleraine. Reports of the work so far accomplished under Capt. Larmouth are satisfactory.

All the Thetford mines are working full time this winter, in order to fill large orders for the mineral.

We understand that an English syndicate is now being formed in London, with a view to the extensive development of asbestos lands in the Eastern Townships.

The Johnstone asbestos Company shipped from the 15th of April until 31st December, 500 tons. Work at the mines last year was greatly retarded by wet weather.

The spar products of the Villeneuve mica mine are being successfully manufactured into porcelain ware. Mr. S. P. Fanchot, Buckingham, has some samples which, for excellence in quality, cannot be excelled.

Mr. W. H. Walker has recently added a number of substantial new buildings to his plumbago property on the Lievre.

The mines of the Excelsior Copper Company at Broughton continue to yield a good average output of excellent percentage.

Work at the new Rockland slate quarries is active, and in the spring an additional number of hands will be put on. The demand is constantly increasing, so much so that the company cannot overtake the orders.

The Memphramagog Mining Company is making application for incorporation. The object is the mining for gold, silver, copper or other metals or ores, or for fuel, plumbago, or other minerals, in the townships of Potton and Bolton, in the county of Brome and elsewhere in the Province. The principal place of business and the head office of said company will be at the Village of Eastman, in said county of Brome. The capital of the company will be fifty thousand dollars, being five hundred shares of one hundred dollars each, with power to increase the capital stock of the company to two hundred thousand dollars. The names, address, and calling of the applicants are William Warne, mining engineer; Charles Chester Smith, contractor; George Edgar Smith, contractor; Corles Corydon Eldridge, manufacturer, and John Eades, miner, all of the Village of Eastman, in the county of Brome; James Clark, farmer, of Saint Etienne de Bolton; Leander Libby, farmer, and Lyman Libby, farmer, both of Dillinton, in said county of Brome; Wm. Jamieson, farmer, of the village of Magog, in the county of Stanstead; Charles Albert Nutting, esquire, advocate, and Thomas Anson Knowlton, trader, both of the village of Waterloo, in the county of Shefford. And said Charles Chester Smith, William Warne, Leander Libby, William Jamieson and Thomas Anson Knowlton are to be the first or provisional directors of said company.

Public notice is given that the persons herein mentioned intend petitioning the lieutenant-governor of the Province of Quebec to obtain letters patent constituting the said persons and all others who may become shareholders in the company thereby created into a body politic and corporate for the purpose hereinafter mentioned. The name and style of said company will be "La Société Canadienne d'Etudes minières." The object of the company is to facilitate the development of mining industries in Canada generally and more particularly in the Province of Quebec, by having studies and analyses made by its engineers and by opening mines and quarries. The company intends, besides, to buy mines and quarries and to interest itself in mining business by participation, limited or otherwise. The chief place of business of the company will be in Montreal. The proposed amount of the capital stock is one hundred thousand dollars. The number of shares will be one thousand, each being of one hundred dollars. The first shareholders of said company are: MM. Schwob Moïse, trader, French vice-consul at Montreal; Dugas Calixte Aimé, judge of sessions, of Montreal; Grant, Charles Henry Albert, trader, of Montreal; Hall, John S., lawyer, member of Provincial Legislature, Montreal; De LaVallée Poussin, Ludovic, civil engineer, of Montreal; Werner, Edouard, of Montreal; Duquet, Cyrille, trader, of Quebec. Messrs. Schwob, Dugas and Grant will be first directors of the said company.

Notice is given that under "The Companies Act" letters patent have been issued under the Great Seal of Canada, bearing date the ninth day of January, 1889, incorporating William Thomas Costigan, merchant; Edward Kinke Greene, merchant; George Bull Burland, president British American Bank Note Company; James Cooper, merchant; George Durnford, chartered accountant, and David Hislop Ferguson, merchant, all of the City of Montreal, for the purposes of pulverizing, grinding, disintegrating, reducing and screening

all animal, vegetable and mineral substances, and all refractory materials of every nature; the acquiring, holding, working, vending and leasing of mineral lands and mineral deposits, and the manufacturing, selling and leasing of mills, plant and machinery of every description, the operations of the company to be carried out throughout the Dominion of Canada—by the name of "The Canada Pulverizing Company" (Limited), with a capital stock of fifteen thousand dollars divided into five hundred shares of one hundred dollars

Ontario.

Application will shortly be made to the Lieutenant-Governor in Council for the grant of a charter of incorporation by letters patent, under the provisions of the Ontario Joint Stock Companies "Letters Patent Act" by the Fuel Oil Company of Petrolia. The objects for which incorporation are sought are: to manufacture from crude petroleum oil, fuel oil, illuminating oil and other products thereof; to tank, pipe and warehouse crude petroleum oil and its products; to act as warehousemen, shippers and carriers of crude petroleum or other articles; to buy, sell, lease or acquire lands with power to sink artesian wells and to produce petroleum, salt or other substances, and to buy, sell, and deal in petroleum and its products and other articles of substances; to enter into contracts for any of the purposes aforesaid and to do all such matters and things as may be needful and useful in carrying on the business contemplated. The operations of the company are to be carried on in the Town of Petrolia. The amount of capital stock of the company is to be fifty thousand dollars.

"The test well," says the *Canada Manufacturer*, sunk about midway between Brantford and Paris to ascertain the probabilities of getting natural gas, reached a distance of 1,700 feet before operations were suspended. The drills pierced a bed of white rock about 300 feet down, which tested them severely, and twenty-four hours' work in it showed but few feet of progress. Lower down, however, a great depth of shale rock—about 125 feet—was bored in one day's work. The hole is now plugged and the machinery removed. It is believed by geologists that the rock formation farther north on Grand river, in the county of Waterloo, is such that better results can reasonably be expected. But it is believed that the chances are infinitely better still nearer Toronto. Four thousand dollars would pay all expenses of a test well, and it seems strange that the thing has not been undertaken in this city, where so much enterprise is exhibited in other directions."

Messrs. Smith & Lacey have their fine new plant, consisting of steam hoist, pumps etc. all in place and ready for work.

Natural gas has been struck at Kingsville, and the story that the well yields eight million feet a day reads as if it had absorbed a good amount of the actual outflow.

Sudbury District.

Accurate information as to the mining industries is often best obtained by questioning the miners who have worked upon the properties. An intelligent miner who has worked in the celebrated Copper Cliff Mine makes the following statements:—The property is now doing very well, and smelting works are erected to reduce the ore on the spot. The copper bearing ore occurs in large masses, sometimes 40 to 50 feet wide, and after working one of

these out perhaps 60 or 70 feet of barren rock will have to be worked through before another pass is struck. A shaft was sunk 100 feet in poor ground, and a drift was then made for 150 feet without results, when an immense mass of paying ore was found. The shaft is being sunk another 100 feet, and a drift will be run from the 200 feet level. The ore yields about 12 to 17 per cent. of copper and contains some nickel.

Since this was written we have received another report from the district announcing that the smelting works are running regularly, and will be making large quantities of matte to be shipped to the United States. Mr. H. T. McIntosh, Cleveland, the secretary-treasurer of the company, and Mr. G. Allen were recently at the mines, and we understand that both these gentlemen were so pleased with what they saw that it is not improbable that another smelter will be added at once.

Port Arthur District.

Nothing of special moment has occurred at the working mines during the past month. As before intimated, the stamp mills at the Beaver and Badger mines are being put in readiness for work so soon as the waters of Silver Creek begin to run. Another small pocket of extraordinary rich ore was recently encountered in the Shuniah Weachu mine.

The lead district east of Port Arthur is being examined by Mr. Peter McKellar, the most experienced geologist of the district, who will report more especially on some recent finds of argentiferous galena north of Black Bay. It is understood that a prominent western editor has engaged this gentleman to examine, when no objections, all promising locations and select average specimens, which will be submitted to eminent assayists in London and New York, and the result of report and specimens made public, in order that investors may know the solid facts on good authority. This will help to keep under those schemers who may attempt to float locations which are not deserving of the puffs which, unfortunately, some who know better, are apt to lend their name to. A few such deals may be the means of filling a few pockets, but the final result is always ruinous to a district.

A few sales of low-priced properties have recently taken place.

Large tracts of iron lands are still being taken up by shrewd speculative Americans north of Arrow and Whitefish Lakes, along the line of the located Port Arthur, Duluth and Western Railway, as well as in the vicinity of the Canadian Pacific Railway, near the Kaministiquia River, at which latter place several mining gangs are at work testing the ore deposits for Pittsburg parties.

The newly established tri-weekly mail stage to Silver Mountain is a great boon to that section and a petition has been forwarded to the provincial government to have the wagon road extended around the north shore of Whitefish Lake.

Port Arthur is justly concerned at present about securing for that town the promised mining school. Such an institution in the vicinity of so many and varied working mines would be well patronized and be of incalculable benefit, saving much loss and failure from unskilled efforts.

There is much talk of a smelter, but this would be premature until the railway to the mines is in operation. A small bonus from the Ontario Government would secure the immediate construction of this urgent necessity.

British Columbia.

The directors of the British Columbia Smelting Company, have decided that they would not wait any longer for a supply of water from the Vancouver Water works, but arrange to obtain the necessary quantities from other sources. The company has either in its ore bins or on the track in its yards, nineteen car loads of ore, and as soon as it can name the day when it actually commences smelting operations, other shipments will be sent forward. It is therefore now to be hoped that all the difficulties which have so much delayed this important enterprise have been overcome.

The annual meeting of the British Columbia Milling and Mining Company was held in their offices at Victoria on 7th inst. The directors of 1888 were unanimously re-elected for the current year, and they will meet in a few days to elect officers. The directors' and auditor's reports and the annual statements were presented and were adopted. Several amendments were then made to the constitution which will greatly facilitate the disposal of stock by the board. A discussion in regard to the general interests of the company occupied the balance of the time of the meeting, and satisfaction was expressed at the position of affairs. The company expect to find in 1889 a year of unrivalled prosperity.

The foreign coal shipments for the month of January from the different mines were as follows:—Vancouver Coal Company, 31,285 tons; Wellington mines, 10,400 tons; East Wellington, 2,180 tons; making a total foreign shipment for the month of 43,865 tons. Iron ore from Texada iron mines, 1,000 tons.

A joint stock company has been formed at Nanaimo embracing a number of gold mines in Texada, and is composed of Messrs. J. E. Jenkins, Richard Prowse, C. R. Miller, Alexander Esson, George Tippet and Wm. Fee. Messrs. C. R. Miller, J. E. Jenkins and Richard Prowse are the directors of the company.

Mr. J. L. Mudge, Assistant General Manager of the Anthracite Company, states that the work of development is being pushed forward at the mines with gratifying results. A new lead has been opened up about ten miles east of the present one, and a colliery will be established there. The further operations are extended the more certain it becomes that the deposits of coal are practically unlimited. It is expected that by May the output will be 350 tons daily, which will give employment to about 250 miners. The objective output is about 1,000 tons per day, and this will be reached several months before the end of the year. Machinery with this capacity is now being placed in position at the mines. Large orders have been received from San Francisco and Pacific Coast towns which are being filled as rapidly as the present facilities will permit.

The strike at the Wellington Collieries is at an end, and the miners have resumed work.

The New Vancouver Coal Mining and Land Company (Limited) was registered on the 30th ult., with a capital of £185,000 in £1 shares,

to take over as a going concern the existing Vancouver Coal Mining and Land Company (Limited), incorporated in 1862. The number of directors is not to be less than four nor more than six; qualification, £1,000 in shares or stock. The first are Messrs. John Galsworthy, F. Tendron, F.C.A., E. J. Woodhouse, W. Needham and J. Fry.

Bell's Asbestos Company (Ld.)

A 22½ per cent. Dividend.—Large growth of business.—Even better prospects for the current year.

The first ordinary general meeting of shareholders was held on Wednesday, 30th ult., at the Cannon street Hotel, London.

Mr. John Bell (the chairman of the company) presiding).

The notice calling the meeting was read by Mr. R. Lander McLaren.

The report and accounts were taken as read.

The Chairman said that when they considered that they had to take stock, and to balance the accounts in two places in Canada, and five places in the United Kingdom, he thought it was creditable especially to the accountant and managing director, and to the staff who had served under him, that the directors were able to meet the shareholders at what they might fairly consider an early date. (Hear, hear.) In alluding to the staff he could not but say, with very great satisfaction, that the zeal which had always distinguished the staff had not abated since the commencement of the company, and every man had done his work as heartily and zealously as in former years before the business was taken over by the company. The manager at Manchester, Mr. Putz, had worked up that branch of the business to a high state of prosperity, and had never worked harder than last year. The manager of every department had been zealous and efficient, and the customers of the company had shown their satisfaction with the work done by continued orders. The continuation of the prosperity they enjoyed was mainly due to the managing director, to whom, although his son, he would say, that to his business capacity and his unceasing labor during many years, and never more than during the past year, the prosperity they enjoyed was in a special sense due. (Cheers.) At first sight the accounts might look somewhat meagre, but when accounts were to be printed and circulated beyond the range of the shareholders, business men could not give those details which they could give in a family circle, because trade rivals would avail themselves of too minute details. (Hear, hear.) Therefore they must not ask for too much detail, but the accounts were not meagre—in the true sense, they showed the true position of the business and its progress. With regard to the share capital, the shares were held by about 230 members, and the money raised by the sale of debenture stock was held by about 100 persons. On the other side of the accounts the bills receivable on hand £3,695, were accepted by firms of undoubted responsibility. The item of "Debtors £35,167," appeared a large item, but it was really one of the healthiest indications of the business. It was really a bank note. Before that figure was put in the accounts all allowances were made, and the discount which had been and has to be allowed had been taken off, and allowed for before the profit was ascertained, and several thousands was the number of people who made it up. The directors could bear with calmness the failure of 1000 persons. On the credit side of the account the figures represented the ordinary purchase of the concern, with the exception of £5,200 unpaid to the vendor. The stock in trade was taken at the exact cost price. They would recollect that it was stated in the prospectus that unsaleable stock was to be eliminated and that stock was to be taken at cost price, and so it stood at the present time. All the stock that was obsolete was taken out and counted for nothing, the rest was real, genuine stock which the company required in its business. The £845 worth of stocks at the asbestos estate in Canada was small. They had only £845 worth of sold but undelivered asbestos when the accounts were made up. The plant, machinery, fittings, fixtures and furniture at London and branches stood at £4,986, which was the exact cost less the amount written off for depreciation during a series of years. In the prospectus it was stated that the machinery and plant were to be taken as they stood in the books of the vendors, subject to an independent valuation to ascertain whether it was fair or not, and the valuers valued it at 40 per cent. above what it was taken over at. (Cheers.) The asbestos estates in Canada stood at the figure they cost, plus the small amount of machinery, and the premises, patents and good will stood at exactly the price paid for them. They could not write anything for depreciation off a property which was

increasing in value, and he believed they could now sell the estates for half as much again as the company gave for them. The directors had made more money for the shareholders than before, they placed to reserve fund £5,000, they retained £9,000 of the profits, which would meet any amount of depreciation they might wish to meet in future times. They would have a big sum by-and-bye from which to take any depreciation. Then he had to refer to a figure which was an agreeable figure, and that was the net profit of £34,421 6s. 9d. In arriving at this profit the stock was taken at the exact cost, and everything which could be written off for bad debts and so on had been done, and every writing down had been done, and this was the genuine and proper profit really and regularly arrived at. In the prospectus the anticipation of a 15 per cent. dividend was held out, but the dividend now proposed was in excess of that figure. But this was not startling to him—it was what he expected and no more. It was the natural outcome of years of labor and thought. This business had been based upon infinite painstaking for many years, and of work which thoroughly considered all the circumstances, and the outcome brought before the shareholder was the natural outcome of careful thought. (Hear, hear.) He had looked forward to this great advance, and he was not surprised at it. The more they looked at it the handsomer it became, and the more important it became. They dealt with many thousands. The business was made up of infinite painstaking in small matters, and they made a small revenue from a constantly extending area. The directors did not wish to startle the shareholders by the announcement of unexpected miracles, but he might say the directors confidently believed that during the year 1889 there would be a very much larger profit than in the year gone by. (Cheers.) With regard to the visit of himself and second son to the property in Canada in February last, he might mention that one object was to see if they could increase the output of asbestos; from the Thetford property alone they could meet the present demand, and payment for a largely increasing dividend from that property alone, and in the meantime the other companies were being brought into working order. The other object of the visit was to examine into the state of the asbestos business in the United States, and see to what extent this company could profitably work part of it. They found that the best way to participate in trade was to supply manufacturers with raw materials as they wanted it. He stated out in Canada that the company would not compete with any manufactured article, but made an arrangement to supply the raw material. Last year he stated that the Canadian property would give a profit of £10,000; the actual figure was £11,000; and the actual profit of the Canadian properties for 1889 would not be a penny less than £10,000. He was sorry to say that Mr. Hartley through failure of health had retired from the board, and in his place the board had elected Mr. R. S. Guinness, of Guinness, Mahon & Co. In conclusion the Chairman moved the adoption of the report and accounts.

Mr. Rhodes Cobb seconded the motion. He said the Chairman had made a most straightforward statement. In the prospectus they were promised 15 per cent.; as a matter of fact they had earned over 30 per cent., of which they had divided 22½ per cent.

The resolution was put and carried.

The Chairman moved a dividend of 15s. per share, payable on the 4th February next.

Mr. Arthur Julian Burnett seconded the motion, which was carried.

The Chairman said that two of the directors retired by rotation, namely Mr. T. B. Lightfoot and A. H. Bell. Those gentlemen had worked well during the year, and offered themselves for re-election.

Mr. Macnair proposed that Mr. Lightfoot be re-elected a director.

Mr. Bird seconded the motion, which was carried.

Mr. W. A. Sparrow moved the re-election of Mr. A. H. Bell as a director. He said he had known Mr. Bell for many years, and knew him to be a most able and capable man. (Hear, hear.)

Mr. Clement seconded the motion, which was carried.

Mr. Elwin proposed the re-election of the auditors, Messrs. Cooper, Brothers & Co., with a remuneration of 50 guineas.

Mr. Clement seconded the motion, which was carried.

A Shareholder proposed a cordial vote of thanks to the directors for the way in which they had conducted the business during the past year, and he would also connect with that the name of Mr. F. C. Bell (managing director), to whom the shareholders owed much of the success of the operations during that time. He had known Mr. Bell for a long time, and he could see nothing but success so long as the management remained in the hands of a gentleman like Mr. Bell. (Cheers.) He congratulated the directors on having secured the services of Mr. Guinness on the board, for that gentleman was one of the most important men in Ireland in regard to his social and political position.

The resolution was seconded and carried.

The proceedings then terminated.

The Relative Importance of the Mining Industry—A Plea for the Gold Miner and His Calling.

[A Paper Read by J. H. TOWNSEND, before the Gold Miner's Association, Halifax, 2nd Feb., 1889.]

Since the day when the fateful mandate went forth, "In the sweat of thy face shalt thou eat bread," the methods by which mankind has sought to provide for his daily sustenance, or to add to his worldly store, have been as varied as have been his needs, real or fancied, in the different degrees of civilization to which he has attained. Amid all the multifarious avocations, the product of the complex civilization of the present age, there stands out prominent before all creative industries the occupation of the miner and the husbandman.

Contrary to the usual custom I place the miner first in a creative sense, because the husbandman calls nature to his aid in that transforming process by which the inutile elements of earth and air are converted into the useful grain and herb, fitted for the best uses of mankind; while the miner by the application of his own brain and brawn brings up from the recesses of the earth the inert ore, releases it from the vice-like grip of its hidden matrix, and converts it into a potent factor in the progress of civilization.

Those intermediary avocations which take the crude products of the mine and farm, and convert them to higher structural forms and make them applicable to more varied uses, add immensely to the sum of the world's comfort and happiness; but it is reserved for the miner and the farmer to add directly to the sum of the world's wealth.

It goes without saying that these two industries lie at the very base and foundation of the social fabric, and furnish the motive power for the continual advancement of the race towards a higher civilization. Whatever may have been the case in those predatory ages of the world's history when might prevailed over right, and brute force was the accepted standard of excellence, it is certain that no race or people have in these later days attained to any exalted position among the nations of the earth unless their social superstructure was underlaid by a great mining or a great agricultural industry. It is only necessary to cite the cases of England and the United States of America in general, and the phenomenal growth of California, Australia and the Cape in particular to establish the correctness of this proposition, while instances are constantly multiplying in our own province of the vivifying effect upon contiguous territory of the prosecution of the mining industry in our midst.

Under these circumstances we should naturally expect to find these two industries held in that high esteem by mankind in general which their importance demands. We would expect to see them fostered and encouraged in every way by statesmen and philanthropists, and that those engaged in them should have so exalted a conception of the dignity of their calling, as to demand and compel the respect of others both for themselves and their industries.

Instead of this happy condition of affairs (to go no further afield than our own province) what do we find to be the case?

Since the publication of the memorable letter of "Agricola," in our early colonial days, there has been a perceptible growth in the appreciation of the business of agriculture, and successive provincial governments have in response to the demands of public opinion, aided in various

ways the dissemination of useful agricultural knowledge, but even in agriculture much remains to be done, and in mining there has yet to be created a healthy public sentiment.

While we have schools of literature, of law, of medicine, of divinity, of art and design, abundantly established and sustained in our midst, schools of agriculture are but in embryo and schools of mines are non-existent; and this, in the very face of the fact that but for the operations of these two industries all others would find their occupation gone, and that in this province the mining industry is the one elastic source from which the Provincial Government may expect a constantly increasing revenue.

The cause of the lack of appreciation of these two great fundamental industries is not far to seek. We can only command that amount of respect from others which we accord to ourselves; true self-respect is the first step necessary towards appreciation by the world.

Farmers and miners as a rule are not proud of their calling, and have no high conception of the value of their work or the relative importance of their industry. The homespun apparel and its hayseed garnishing is regarded by the young men of this generation with a feeling of aversion which is working much ill to themselves and the country, and unhappily the term of "miner" and especially "gold miner" has become, for reasons best known to all of us, a bye-word and reproach.

While these two cognate industries stand in much the same position as regards the strength of their claims for recognition and appreciation, this paper is concerned only with the case of the miner in general and the gold miner in the Province of Nova Scotia in particular.

It is usually easier to discover a want than to suggest a remedy, but in the case of the gold-mining industry in this province there are several schemes which have been attempted or proposed of late, looking to the advancement of the business to a higher status and compelling for it a more enlightened appreciation to which it would be well to advert in this connection.

First* in order of these is the Gold Miner's Club, the offspring of several unsuccessful attempts to establish a general gold-mining association. The Club has now completed the first and most trying year of its existence, has proved itself a potent engine for good, and should commend itself to the enthusiastic support of everyone interested in the industry. It can, if well supported and with honest intent, do much to abolish that stigma of reproach, to remove that aroma of suspicion, under the burden of which the gold industry of the Province has staggered on to its present position and standing. If it becomes, as it ought to become, the recognized exponent of the gold miners of the Province, it can do much to assist wise legislation and to prevent hasty or crude tinkering with the Mining Act.

There is also a comprehensive scheme afloat, which has received the endorsement of the Club, looking to the recognition by the General and Provincial Governments of the importance and value of the mining industry here, by the establishment of an official assay office at Halifax, which would give an impetus to the pioneer work in every branch of mining and would especially relieve the gold industry from many burdens with which it has long been freighted. Those who have this scheme in hand are entitled to and should receive the assistance and moral support of all who properly value the great mining resources of this Province.

There is yet another scheme which has only been mooted, but which needs immediate ven-

lation and development; the establishment of school of mines in embryo.

Amidst all the difficulties against which the old industry of this Province has made a successful struggle, the greatest has been incompetency. Fraud has unquestionably been a large factor in the depreciation of the gold mines of Nova Scotia as in every gold producing country; but for every dollar of capital wasted in this connection ignorance and incompetence are responsible for seventy-five per cent. of the loss.

The importance of the mercantile marine having long been recognized, facilities are provided by means of which any bright young sailor can fit himself for a master or mate's position, thereby elevating himself and increasing the efficiency of the service. It is passing strange that until very lately no such step as this has ever been thought necessary in connection with the great business of mining in this Province. Probably the greatest need that exists to-day in connection with mining generally and gold mining in particular in Nova Scotia, next to the lack of capital, for a fuller development, is the want of honest, intelligent and capable overmen. This is a statement that will be fully concurred in by anyone having experience in the management of mines here during the past ten or fifteen years. Why is it that the young intelligent miner, who having learned the A, B, C, of his calling (how to break rock properly), desiring to fit himself for a higher position finds no avenue open to him, no such facilities provided?

The Government that will provide the means whereby the miner, who has proved himself capable and intelligent, can superadd to the practical knowledge acquired underground a rudimentary knowledge of arithmetic, surveying and mensuration, so that he can keep time, take measurements and estimate quantities, have some idea of mechanics so that he can look after machinery, and so much of geology as will enable him to watch intelligently the constant changes in the formations, will entail upon the Province a lasting debt of gratitude, and will do more to place the business of mining upon a practical and business-like footing than by any other conceivable expenditure.

While these agencies here referred to, which have been attempted or proposed, have in them much power for good to the gold mining industry there is nothing that can so vitally affect the calling for good or ill as the conduct of those directly engaged in it.

"Providence helps those who help themselves," and neither providence nor anyone else will accord to the Gold Mining Guild of this Province an honorable position among provincial industries unless the persons engaged in prosecuting the business are actuated and governed by that code of commercial honor which, in all other callings, furnishes the groundwork for mutual faith and confidence. The Gold Miner's Club has in this respect a great field for usefulness before it, and if it succeeds in establishing a stricter code of mining ethics it will do more than it can in any other way to establish a lasting claim upon the fraternity, and to demonstrate its right to a continued existence.

Haulage in Mines.—At a recent meeting of the Engineers' Club, of Philadelphia, Mr. A. W. Shaefer stated that the cost per ton—mile of haulage in Pennsylvanian anthracite mines was as follows:—

Mules..... 3-64d.
Steam locomotives.... 1-20d.
Electric motors..... 0-80 to 1-34d.

A Visit to a Charcoal Iron Furnace.

(WRITTEN FOR THE REVIEW BY SAM'L D. MILLS, SUPT. MARTEL FURNACE CO., ST. IGNACE, MICH.)

Popular ideas of blast furnace work being generally of a somewhat vague and misty nature, it may interest some of your readers if a plain and simple description of the work at a furnace making charcoal iron is placed before them. The writer had the pleasure of reading a paper upon the subject before the Canadian Institute last year, and this is to some extent a rescript of the same.

The charcoal furnace has been chosen instead of the coke or anthracite furnaces because it is more suited to Canada, and although there are charcoal furnaces to be found where the entire plant as well as the general management are of the crudest possible description, more nicety of arrangement and more exact attention to details is required in this kind of furnace, more especially where "car-wheel iron" is the product sought for, than in either of these.

Let us imagine ourselves visiting a charcoal furnace of the best type, with free permission of the owners to examine all the minutiae of daily work. As we have not time to examine into the mining of the ore, or the manufacture of the charcoal, we will presume that both have been delivered from a distance by rail.

Before entering the Stock-house our attention is directed to the very favourable position of the furnace to railway connection, the contour of the ground being such as to allow the furnaces being placed about 20 feet below the level of the main track, so that the ore cars, by entering the Stock-house that height above the floor, have every facility for "dumping" the ore. On entering we find that there are three parallel tracks, about ten feet apart, traversing the building overhead from end to end, and under these are six large compartments or bins, each of sufficient capacity to hold a six months' supply of the variety of ore for which it is used. The partitions which separate these bins run only part way across the building, leaving a passage of sufficient width to admit a horse and cart for the carriage of the ore from the respective bins to the crushers. The crushers, which are very powerful machines, with a capacity of 50 tons of hard ore per day of 10 hours, are provided with elevator belts which convey the crushed ore up into the ore pockets, from whence it is charged into the ore buggies. These pockets are six in number, and are heavily framed together, forming a hexagonal structure rising about 30 feet above the floor of the Stock-house; the bottom of each pocket is about 9 feet from the floor, and is fitted with a spout having a charging spout at the end worked by a lever which serves to cut off the supply at will. We are next shown the method by which the ore is weighed. We notice that the floor beneath the spouts of the pockets is occupied by a platform scale upon which one of the "stock weighers" has just wheeled an odd looking machine like a bucket on wheels. This buggy is about 2 feet in diameter and 2 ft. 6 inches in depth. Its bottom is formed in the shape of a low cone hanging by its apex to a short perpendicular bar supported by a lever which lifts the cone till it closes the bottom of the buggy, and when necessary allows it to drop again so as to discharge the contents equally all around its circumference. When the bottom is to be kept closed the lever is held tight by a peculiar latch. The stock weigher now proceeds to fill his buggy. He drops the moveable spout beneath one of the pockets and

allows the ore to run till the upper indicator of the scale shows that he has the correct weight. He then drops a latch which releases the next beam of the scale, and repeats the operation from another ore spout, which in its turn is followed by a third, and again by a fourth spout. Then comes a small quantity of limestone and the charge is complete. We observe that there are two more beams to the scale, and are informed that they are not in use at present, as the furnace is running on a mixture of only four ores, though sometimes, we are told, the full set of ore pockets and scale beams are needed. Some of the party having expressed a little curiosity regarding the use of the limestone, as "it will not make any iron," are informed that it is indispensable, as the ores now in use are very pure, but contain some silica (quartz) and alumina, and the addition of the lime causes these substances to melt more easily and form a good fluid slag or cinder, as it is commonly called; also that it has an important influence on the quality of the iron produced and on the working condition of the furnace. We also learn that some ores, being deficient in alumina, require the addition of a little clay (silicate of alumina) to keep the furnace in good working order. If this were neglected the slag would be viscid and "sticky" when hot, and would "build" on to the walls of the furnace, eventually causing scaffolding in the furnace, or, in other words, stopping the descent through it of the mingled ore and fuel, a state of things which is very troublesome for those about the furnace and very unprofitable to the owners. Meanwhile the ore buggy has been wheeled off the scale and round to the hoist or elevator, which takes it up to the top of the furnace. As we have yet to see the charcoal weighed we proceed to the coal-house, next the Stock-house. This building we find to be a mere shed, very lightly framed, and covered only with light sheet iron. In it are standing three box cars, in one of which two men are at work forking the coal on to a large screen, which is so supported as to admit a large sheet iron buggy about 4 feet square and 5 feet in height being run under its end in order to catch the coal as it falls from it. The fine coal and dust (braize, as it is termed) falls through the screen and forms a heap on the floor behind, which is removed from time to time. When this buggy is filled it is taken by the "coal weigher" through the door at the end of the "Stock-house" to the coal scales near the "hoist." Here the weight is adjusted so as to agree with that marked on the beam of the scales, and the car is then run on the "skip" or platform of the elevator. This elevator has two skips, one of which ascends while the other descends. After the loaded buggy has gone up we take our places on the empty skip, and the elevator lands our party safely at the top of the furnace. One of our party immediately exclaims, "But where is the furnace? I don't see any fire," showing that to some of the party a closed top furnace is a novelty. As soon as the charge in the "hopper" has been lowered and the gas has cleared off we step forward to take a look at the fittings by which the charging is accomplished, and looking down into the furnace perceive that it is closed by a circular iron "hopper," with a conical bell in the centre, exactly like the cone in the iron ore buggy, only a great deal larger, and worked in a similar way, except that it has two heavy iron rods to hold it up, and the great cast-iron beam which takes the place of the lever on the buggy requires a powerful winch to move it. We now begin to understand some-

thing of the *modus operandi*, and stepping back we watch the filling in of the next charge. First of all a buggy of ore which has just come up is run over the mouth of the "hopper," the wheels of the buggy straddling the opening. The "top-filler" takes care to get it centred exactly, so that the apex of the buggy cone is perpendicularly over that of the furnace cone. He then releases the lever of the buggy and the ore falls down very evenly all round. Then another buggy of ore goes in in like manner, followed by two buggies of coal, the latter are carefully levelled, and then the cover or "seal," (a heavy cast iron lid) is let down over the hole. The "top filler," having ascertained that there is room for another charge (he does this by means of a light iron rod which he passes down into the furnace through a hole in the iron plate surrounding the mouth of the cover), gives the handle of the winch a couple of turns, then reverses it, raising the "bell" or cone again, and the hopper is ready for another charge. On learning that it is near time for casting we descend and proceed to the Casting-house. We have, however, a little time to spare before this operation begins, and decide to "take in" the bottom of the furnace, blowing engine, etc. The engine-house is a substantial brick structure about 30 x 35 feet and 30 feet high, surmounted by an iron tank 5 feet deep and the full size of the building. Here we find the blowing engine and a small engine used for driving the crushers, laths and other plant in the machine shops, also two powerful steam pumps. The blowing engine is of the upright type, with the steam cylinder directly under the air cylinder—the former being about 32" diameter, the latter about 72"; the stroke about 48", delivering 226 cubic feet of air to the furnace at each revolution. We then pass out and note the direction the wind pipe takes to the "ovens," and on our way back pass through the boiler house. Here there are six tubular boilers, 4 feet in diameter by 35 feet in length, set in pairs, one furnace heating two boilers. Only four of these are in use at present, the others being held in reserve in case of repairs being needed upon any of those in use. They are also "changed off" from time to time to permit them being thoroughly cleaned and "scaled." There is but little solid fuel used, as the gases from the furnace are generally more than sufficient for all requirements. The wind-pipe passes behind a lofty cylindrical structure, composed externally of large sheets of boiler plate rivetted together, forming a sort of tower, probably 15 feet in diameter and 60 feet in height. This stood rather to the rear of the furnace and next to the elevator, on the other side of which was another of the same construction, the wind-pipe being carried on behind it also, and connected with a branch pipe. We were shown the valves at the rear by which the wind or "blast" can be shut off. There was also an outlet leading from the bottom of the wind-pipe (also with a valve) where it turned into the "oven" and down into a flue communicating with the large draught stack. This stack was a fine structure, about 12 feet in diameter at the base and over 150 feet in height. Passing round to the side of the "oven" nearest to the "stack," as the furnace itself is generally called, we found a similar branch pipe with the upper part connected with a large pipe which ran completely round the furnace. This and the branch from it to the oven were much larger than the blast pipe on the other side of the oven. The downward portion of the branch had also a valve connected with the "gas flue," leading underground from the "down corner" (a large pipe

extending from the side of the furnace near the top down to the ground, at about 10 feet from the side of the furnace, which serves to lead the gas from the top of the furnace down to the underground flues, by which it is then led off to supply the boiler furnaces and three ovens.) In answer to an enquiry how and why it was used to heat the ovens, we were informed that on opening the valve leading up from the gas flue, and also that leading down to the draught stack flue—the other two valves to the "stack" and those from the blast pipe being first closed—the gas passes into the oven, and coming into contact with the heated brickwork inside takes fire and burns with an intensely hot flame. The ovens are lined with fire-brick, and the space is sub-divided into perpendicular flues, so arranged that the flame, and intensely heated gases resulting from the combustion of the furnace gas, have to pass up and down twice the entire height of the oven before finding their way out past the valve to the draught stack. This is allowed to continue for two hours, then the gas is shut off; the valve leading to the pipe round the furnace (the "bustle" pipe) and also that leading from the blast pipe are opened; the blast passes in at the back of the oven and up and down through the now intensely hot flues, and then passes into the "bustle" pipe at a temperature of 1200° F., or up to 1800° F. if so desired; it then passes in the opposite direction to that followed by the gas, so that it leaves the oven at the hottest point. On reaching the "bustle-pipe" the blast passes from it down through branch pipes ("belly pipes") to the "tuyeres," and by them into the furnace. The connections from the "oven" to the "bustle pipe" and the "belly pipes" are all lined with fire-brick to enable them to withstand the tremendous heat to which they are exposed. The ovens are used alternately—one heating while the other is in use.

One of our party having enquired how it was that there was any combustible gas given off by the furnace, the action was described to be of the following nature:—The ore, in passing down through the furnace, undergoes two separate and successive changes, viz., reduction and then fusion. All iron ores—that is, all ores used for the production of iron—consist of combinations of iron with oxygen. Associated with these oxides of iron there are a great number of other substances, notably silica, alumina, lime, magnesia, sulphur, phosphorus, etc., all combined with each other, or with a small amount of iron. With the exception of the lime, which frequently occurs as carbonate, and the silica, which often occurs as free silica or quartz, it has been proved that the reduction, or the separation of the iron from the oxygen, takes place at a temperature far below that required for the fusion either of the iron or of any of the combinations of the associated bodies. Simultaneously with the reduction another action takes place, viz., carbonization or absorption of carbon by the ore. This mysterious action, by which the carbon is absorbed and fixed in the pores of the ore, so as to disintegrate it, much in the same manner in which frost disintegrates soft brick that has formerly been moistened, can only take place in an atmosphere of gas containing carbon, mon-oxide (C.O.), in the proportion of two or more parts to 1 of carbonic acid (C.O₂); reduction also requires the same condition. This action commences almost immediately after the ore has been placed in the furnace, although the temperature at the top immediately under the "bell" is not more than 350° to 400° F. In order to understand this clearly it is best to take first into consideration the

action at the "tuyeres," and follow the gas in their passage upward through the mass of ore and fuel. At the "tuyeres" we have the air blown in at a temperature of say 1200° F. composed of about 23 parts of oxygen to 77 of nitrogen by weight, leaving out the small quantity of carbonic acid and moisture always present. The nitrogen may be regarded as inert as it merely carries in 1200° F. of heat, leaves 800° F. to be utilized, and passes off unchanged at 400° F. The oxygen attacks the highly heated fuel, burns it, forming carbonic acid which is again immediately reduced to carbon mon-oxide as it passes up through the heated charcoal. Owing to the constant addition of fresh supplies of cold ore and fuel the furnace is naturally colder towards the top, so this carbon mon-oxide (C.O.) gas passes up unchanged until it reaches a point in the furnace where the temperature is so low that carbonic acid (C.O₂) cannot be decomposed by the carbon in the charcoal. But, as we have already seen, the action of the carbon mon-oxide on the ore still continues, so that the ore absorbs some of the carbon (C.) from the C.O., so forming some C.O₂, and at the same time giving up its oxygen to combine with some more of the C.O., making more C.O₂. This action can continue until the proportion of C.O₂ to C.O. is about as 1:2, after which it appears to cease. Now, as you know that carbon mon-oxide burns with great evolution of heat, you can understand how we heat our stoves and boilers by utilizing the waste gasses that in former days were allowed to escape unheeded.

(To be continued.)

NOTICE.

Tenders will be received by the Department of Inland Revenue until

MONDAY, the 4th March, proximo,

From parties desirous of leasing the privilege of

FERRYING ACROSS THE OTTAWA RIVER

BETWEEN

ST. THOMAS D'ALFRED IN THE COUNTY OF PRESCOTT, PROVINCE OF ONTARIO, AND DOMINION OF CANADA,

AND

MONTEBELLO, IN THE COUNTY OF OTTAWA, PROVINCE OF QUEBEC, AND DOMINION OF CANADA,

In accordance with the terms and under the conditions set forth in the regulation, copies of which can be obtained at the Department of Inland Revenue, Ottawa.

Each tender must state the amount the party tendering is willing to pay per annum for the privilege referred to, which amount will be paid in advance, the term of lease being for five years, from the 1st day of May, 1889.

Each tender must be accompanied by a cheque marked "good" on one of the chartered banks doing business at Ottawa, or by Dominion currency to one-half the amount of the per annum tender. This amount will be credited on account of the first years rent in the case of the accepted tender, and all other cheques or moneys will be returned, except in the event of withdrawal, in which cases no refund will be made.

All communications must be addressed to the Commissioner of Inland Revenue and endorsed on the envelope "Tender for Montebello Ferry."

Any newspaper inserting this notice without first obtaining the authority of this Department will not receive payment therefor.

By order,

WM. HIMSWORTH,
Secretary.

Department of Inland Revenue, 1
Ottawa, 11th of Feb., 1889.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Ice, Public Buildings," will be received at this office until Thursday, the 28th inst., for filling the Government ice house at the Rideau Canal Basin, Ottawa.

Sealed Tenders, endorsed "Tender for Ice, Rideau Hall, &c., will also be received at the same time for filling the ice house at the Governor-General's Residence, Rideau Hall.

Tender to state price per block of the following dimensions: viz.,—3 ft. by 1 ft. by 1 ft., which price must include cost of packing and of the sawdust required for that purpose.

All sawdust on premises to be removed; only new sawdust to be used.

The ice to be measured before being packed in the ice house and payment to be made accordingly.

N.B.—The ice must be taken from above the Railway Bridge, crossing the Ottawa River above Chaudiere Falls.

By order,

A. GOBELL,
Secretary,

Department of Public Works,
Ottawa, 16th Feb., 1889.

88, 90, 92, 94 Rideau, 15 to 23 Mosgrove
and 186 Sparks Sts.

Satchels, Horse-Blankets, Beef and Oil-
Tanned Moccasins.

OTTAWA.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

DEPARTMENT

OF

Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and

before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits

a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have
used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force
thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet
from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler,
and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly,

F. L. BARTLETT."

Address for further particulars,

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

A. S. HARDY,

Commissioner

Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or to work Minerals on any of their Mining Lands and Mineral Reservations,
Covering nearly a

Quarter of a Million Acres

In Eastern Ontario, and principally within the belts containing

4 ONTARIO CHAMBERS, TORONTO.

Will buy undeveloped iron ore and other mineral properties.
WANTED. — Deposits of Magnetic Iron Ore, Red Hematite,
Brown Hematite, Galena, Iron and Copper Pyrites, Mica, Soapstone, Marble, Gypsum, Baryta. Samples can be sent by Sample Post for 1 cent for 4 oz. or up to 24 oz. in weight.
Information regarding mines cheerfully given. Correspondence solicited. Crown Land Business attended to.

CHEMICAL APPARATUS! OF EVERY DESCRIPTION.

Glass, Porcelain, Stoneware, Platinum Crucibles of every sort, Analytical Scales and Weights, Fine Chemicals and Reagents, including Volumetric Solutions. Every requisite for Analysis or Experiment. For Sale by

LYMAN, SONS & CO.,
334 St. Paul St., Montreal.

Illustrated Catalogue mailed on receipt of 10c. or Business Card.

Boiler For Sale.

N EIGHTY H.P. TUBULAR STEEL BOILER made by W. C. White, Montreal, 15 ft. x 5 ft. 4 in. eighty 3 1/2 in. tubes; smoke stack 45 ft. long; guylards and guys. Very little used. Equal to new. Price on cars, \$600. Address

P. O. Box 6,
MONTREAL.

Johnston's Fluid Beef

CONTAINS
ALL THE ELEMENTS,

Without a single exception,

For the formation of Flesh,
Muscle and Bone.

IT IS INDISPENSABLE TO
THE INVALID

seeking health; TO THE ATHLETE seeking to develop strength of muscle; FOR CHILDREN to lay the foundation of strong bodies; to the HOUSE-WIFE to make rich gravy and strong soup.

Victor Electric Fuses.

Superior to all others for Exploding any make of Dynamite, High Explosives, or Gelatine Powder. Each Fuse is tested and warranted extra strong and waterproof. Low grades of Dynamite Powder will do ten per cent. more execution if detonated with Victor Electric Fuses.

VICTOR BLASTING MACHINES.

Latest improvements, made in three sizes, easy to operate, strong and durable. No expensive repairs, low in price, will fire any make of Electric Fuses.

MANUFACTURED ONLY BY

JAMES MACBETH & CO.,

128 Maiden Lane, N.Y., U.S.A.

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Electric Pumping in Collieries.—The application of electricity to underground pumping has enabled Mr. F. Brain to give particulars which prove that this is a method of transmitting energy capable of wide and economical application. The electric pumping plant, which the author describes, has been put in to deal with the main feeder of water in the deep working of the Trafalgar colliery, Forest of Dean. The pump and motor are placed at a distance of 1650 yards from the bottom of the shafts and water has to be forced by this pump to a vertical height of 300 feet to the pit bottom. The pump, a double 9 inch plunger with 10-inch stroke, is driven by the motor running at 650 revolutions per minute to 25 revolutions of the pump. Trials gave for the engine 29.49 indicated horse power to 10.36 actual horse-power of water lifted. The actual proportion of power given off by the steam engine used to lift water is therefore 35 per cent. The first cost of the plant was £644, the pump (£130) and pipes not being included. The cost of pumping 114 gallons per minute with this machinery, through 1300 yards of 7-inch pipes rising 300 feet vertically, is £7 17s. for one week's pumping, twenty-two hours per day, or in other words 0.02d. per horse-power, or 1.8d. per 1,000 gallons of water raised. When not required for pumping, the power available is used to drive a small fan underground.

Premature Explosions of Gunpowder.

—W. H. Williams, writing to the London *Miner's Journal* says: "I have had a very extended experience with blasting by gunpowder in mines, and from careful daily observation I found that one cause of premature explosion resulted from charging the bore hole with naked powder, loose grains of the powder rest on their way down on the projecting and irregular sides of the bore, and when the stemming was done a bit of grit in the tamping, striking, or giving off a spark would convey fire to the powder charge by these loose grains of powder, and a premature explosion would be brought about. The other cause was that the naked powder filled up a greater part of the bore hole when first run in than it would occupy when stemmed, consequently the metal stemming bar, being of small diameter than the bore hole it went down in the powder charge, leaving a lining of the explosive some distance up its sides, forming really a hole lined with powder. Stemming then goes on, and a bit of grit or other exciting cause producing a spark, the powder charge is exploded prematurely. I have known charges of powder go down 3 and even 5 inches when rammed or stemmed below the point they stood at when loosely run into the bore hole. To remedy these very dangerous and sometimes fatal occurrences I first had every powder charge placed in a good case (cartridge) and gently but firmly pressed to the bottom of the bore hole. placing on top of these a small woollen wad about three inches long made of pump ring lagging (called engine shaggy). This wadding was a strip about 4 inches long and 3 inches wide tied tightly in the middle and allowing both ends to spread out something like a figure 8 flattened top and bottom. This went down on the cartridge and not only would it brush down all loose grit but spread out all over the unequal sides of the bore hole and set up a perfect non-conducting separation between the material used for stemming or ramming, and the powder in the bottom of the bore hole.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

UNION CHAMBERS, 14 Metcalfe St.
OTTAWA.

Vol. VIII. MARCH, 1889. No. 3.

Obituary.

Sir John Morris, Kt., J. P., Chairman of the Anglo-Canadian Phosphate Co., Ltd., died Feby. 27th, at his residence, Enfield, London, from inflammation of the brain. He was for many years head of the firm of Morris & Griffin, fertilizer manufacturers, Wolverhampton, and was one of the earliest English investors in Canadian phosphate lands. He was formerly Mayor of Wolverhampton, and was for ten years Chairman of the Chemical Manure Manufacturers' Association. The deceased gentleman was greatly beloved for his many amiable traits and was highly esteemed for his business integrity.

The Geological Survey. Its Staff and its Director.

As a country expands and progresses it is only natural that its public institutions should correspondingly keep pace with its growth, and when these are kept up by money voted by parliament, it is to be expected that their management should be watched by the people, and their action commented upon. A wise government, to foster the industries of its country keeps up establishments intended to aid these industries by their investigations, experiments, and researches, and by announcing results so afford their experience to all interested. The experimental farms will be of untold value to the agriculturist and the intending settler in a country new to him; and in like manner the Geological Survey is of the utmost value to the miner, the prospector, the capitalist and intending investor in mineral lands. In the earlier days of Canada when Sir William Logan almost single-handed undertook the work of a Geological Survey, a comparatively small area of that which now forms the Dominion, was invested with any particular degree of interest, and his labours met all the requirements of his day. Now with the unbroken sweep of country from ocean to ocean and territory extending to within the Arctic circle giving evidence of mineral wealth, some idea may be formed of the increase of work the Geological Survey Director has to control, and the wonder is how with the comparatively limited staff and means at his disposal, so much work has already been achieved, as the annual reports of the Survey show Dr. Selwyn to have accomplished and to be still carrying on. It is not our province to flatter or adulate an official for doing his duty; that, the country expects of him; but we do feel that it is not out of place

in a publication like the CANADIAN MINING REVIEW to defend an official when unjustly attacked. These remarks are drawn forth from a telegram which appeared in the *St. John Globe* of the 17th February last, belittling Dr. Selwyn, and charging him with favouritism and partiality in selecting localities for survey. It is not the object of the institution he controls to advertise mining properties in any one locality by giving them a preferential report, but it is its object to follow up any new discoveries made by individuals and to publish the results of its labours in such districts for public use. Such a course may have led jealous persons to assert some particular survey as savouring of partiality, but it is only ignorant or disappointed parties whose minds could conceive such narrow views of Dr. Selwyn, whose career of scientific investigation can be pointed to as evidence of his whole course of impartial action through life. As an evidence of the esteem in which his work is held abroad, the comments of men of standing in the United States and elsewhere give no uncertain sound. Mr. E. E. Thompson of New York, says of the maps published by the Director that they are "truly magnificent; my highest expectations are more than realized in them; they are indeed models of method and precision, and the most noble monuments to their originator." Another gentleman of very high standing in the Lower Provinces speaking of Dr. Selwyn's maps says: 'It is my unbounded appreciation of what has hitherto been done by the corps of the Geological Survey under the Directorship of an able and eminent chief of whom Canada may well be proud, that prompts me to suggest and impels me to advocate the expenditure of a few tenths of a cent more apiece, to enable the Survey to continue recording and establishing in the most satisfactory manner work that *is being well done*, and which ensures to the industrial development of the country while it will be at the same time a source of honest national pride *when we compare our record with that of other countries*.' Surely such comments as these speak volumes for Dr. Selwyn's ability and work, and the comments of the *St. John Globe* depreciating these labours would not be worthy of notice, were it not that if allowed to stand unnoticed, the idea might gain ground that there was some cause for them. Any visitor to the Geological Museum must at once be struck with the order and arrangement existing in the display of its specimens, and when the small vote at the disposal of the Director is taken into account, the only wonder is how so much can be made out of so little at his disposal. The vast extent of territory represented by specimens testify to the field work done, and the annual reports are an index of the care bestowed on the outdoor labours of the staff. Dr. Selwyn can afford to stand all attacks without harm being done, but at the same time narrow minded and ill-natured thrusts which irritate like a thorn in the flesh, require like the latter a magnifying glass to show their insignificance, and when disposed

of share the fate of the thorn, in being cast aside as worthless matter. While upon this subject we would again remind the Federal Government that the accommodation provided for this important branch of the public service is utterly inadequate to its wants and uses. The present building, besides being too small, may be destroyed by fire at any time. Just now it contains probably the most precious collection of minerals, fossils, and botanical specimens contained in any one building on the North American continent. The loss of such would be irreparable. We trust that in order to do justice to this valuable collection, the day is not far distant when the Geological Survey and Natural History museum will be provided with a much more commodious building than that which it now occupies, and that the present able director may be spared in health and strength to assist for many years to come in its management and supervision.

The American Institute of Mining Engineers to Meet in Ottawa.

Our readers will be gratified to learn that arrangements have been made for holding the fall meeting of the above Institute in Ottawa early next October. The suggestion was made by Dr. Bell of the Geological Survey, Mr. R. G. Leckie and Major Markham, Canadian members, who attended the late New York meeting, and was very warmly received. A meeting was held in the office of the CANADIAN MINING REVIEW on 5th inst., when it was decided to call a larger one. This resulted in a very influential gathering in the City Hall on the 8th inst., at which it was resolved to invite the Institute to Ottawa and to take steps to raise money for their proper reception. A deputation consisting of upwards of twenty leading citizens and members of parliament for Ottawa and the surrounding counties waited upon Sir John Macdonald and requested aid for this purpose. In response the Government has agreed to grant \$1,000. This, it is confidently expected, will be largely increased by the governments of Ontario and Quebec. The consent of the Council of the Institute was required in order to appoint Ottawa as the place of meeting. This has been obtained, and the secretary, Dr. Raymond, has written that the way is now clear for us to have the autumn meeting. This will be a great boon. The Institute numbers over 2,000 members, and embraces wealthy mine owners and distinguished practical scientists. Their coming to the Capital of the Dominion will increase the importance of Canada and Ottawa, not only to our neighbours, but to the world generally. Excursions will be organized to our mining districts in all directions. These will have the effect of bringing our phosphate, mica, iron, copper, gold, silver and other mines under the direct personal notice of the men most likely to invest or to influence the investment of money in them, and will be certain to lead to sales of

both developed and undeveloped properties. Other interests will also be sure to benefit, as the average American is always open for any opportunity for the profitable investment of money.

The interest which capitalists may take in our mining districts will necessarily be heightened after personal investigation. Even those who may not invest, if they are afforded a pleasant visit will come again. One good feature of these meetings of the Institute is that the members always bring their ladies with them, and friendships formed at agreeable meetings often last for life. By making the acquaintance of our own scientists they may draw from them some of their hidden knowledge, and the meeting may thus be advantageous. The reading and discussion of papers on subjects of practical importance will be a treat to our citizens and mining men; and the speciallists in different departments may give valuable hints or advice on the ground during their visits to the various mining districts. The publication of the volume of Transactions referring to the "Ottawa Meeting" will tend to bring this region into prominence in mining circles throughout the world.

We have so far said nothing of the direct and immediate advantage which our city and the country generally will derive from the visit of such a large number of strangers with money to spend. Our railways, steamboats, hotels, shops, cabmen, etc., will profit to a very considerable amount in the aggregate, although this will be insignificant in comparison with the larger advantages which will be sure to follow.

Since this was written, the Provincial Government of Ontario, with a foresight that does it credit, has made a grant of one thousand dollars to the fund. We now look to the Province of Quebec for a similar contribution.

Phosphate Quality.

Much perplexity has been occasioned in the minds of Canadian phosphate producers and dealers by the variation in the demand for quality on the part of English buyers of phosphate. When the trade began, some 12 years ago, no guarantee over 70 per cent. was ever asked for. In a few years 75 per cent. guarantees were required, and then 80 per cent. was strenuously demanded, and for the past three or four years anything under that standard was very difficult of sale, or had to be disposed of at much lower relative prices. The reason generally adopted by Canadians as an explanation of this demand for high guarantees was that owing to the great uncertainty of the results of sampling and analysis the buyer often had a chance to buy in at a low price a good lot of phosphate which had chanced to be rated below the guarantee standard and was therefore rejected. However this may be, there has been a sudden reaction since last summer from this practice and up to the present not a ton of 80 per cent. phosphate has been sold for next season's delivery to England, while there has

been a lively demand for grades below 75 per cent., and lower qualities have been sold than ever before, in fact phosphate that has heretofore been thrown upon the dump as worthless is now found to be marketable. An explanation has just been received from an English correspondent that throws new light upon the subject. It is well known that our phosphate, after being finely ground, is mixed with about an equal weight of sulphuric acid in order to render it soluble in water. In this state it is known as superphosphate. It is found that, although at first nearly the whole quantity of phosphate may be rendered soluble by the acid, after a while a portion "reverts" or becomes insoluble again, and as it is usual to sell superphosphate upon the basis of the "available," or soluble, phosphate that it contains so that what has reverted becomes a loss to the manufacturer, or if sold on the full analysis the farmer may think he has sustained a loss. Canadian phosphate is higher in quality than almost all others, but is said to revert more than do some of the lower grades. These remarks will explain the words of our correspondent, who says, "It must be remembered that not only are manufacturers wishful to get a price for the phosphates that revert, but farmers are beginning to see that it is better to buy at a low price supers of say 26 per cent. phosphoric acid (equal to about 57 per cent. of phosphate of lime) than to give a relatively very much higher price for a higher percentage superphosphate, and the bulk of the trade is now in supers of about 26 per cent. phosphoric acid, which can readily be made from the low class easily worked phosphates, and this is, of course, against high grade Canadian."

Very likely reasons may be found to change back again to the use of higher grades, but even if it is not so there is enough low grade phosphate in all Canadian mines, heretofore discarded, which, if judiciously mixed with the high grade and the expense of cobbing dispensed with, will render the returns of this industry more profitable than ever.

The Canadian Asbestos and Antimony Company, (Limited.)

This Company has been formed in London to purchase and develop certain mineral properties owned by Dr. James Reed in the eastern townships, comprising 16½ square miles, with mining rights over 9,500 acres in addition. The capital is fixed at £160,000, in £5 shares, of which 22,000 are now offered for subscription at par. The purchase price is £130,000, payable £30,000 in cash, and the balance in shares, leaving £30,000 for working capital. The Directors of the new concern are: Sir Henry A. Isaacs, St. George's House, Eastcheap, London, Chairman; The Right Hon. Lord Gifford, V. C., Reigate, Surrey, Vice Chairman; David J. Carmichael (late senior member of Council, Madras), 21 Sussex Gardens,

London, Lieut.-Col. H. C. Gleadow, 5 Cornwall Gardens, London, W. A. Vanderbyl 3 Great Winchester Street, London, and R. H. Jones, 82 Queen street, Cheapside London. The local board in Canada includes Hon. Francis Laugelier, M.P., and Mayor of Quebec; Frank Ross, Director of the Quebec Bank, Quebec; and Dr. James Reed, Reedsdale. The properties to be acquired are: (1.) The Nicolet freehold estate, containing 2,267 acres, seven miles from Garthby station on Quebec Central Railway; (2.) a freehold estate at Thetford, comprising 7,776 acres, with mining rights over 9,500 acres; (3.) the Coleraine freehold estate, lots 27, 28 and 29, containing 450 acres. The *Financial News* and *Financial Times* speak very favourably of the scheme and its promoters; but the *Stock Exchange Times* describes the project as "another attempt to draw funds from easy going people who have more money than wits." This paper concludes its criticism thus: "The vendors will take £80,000 out of it, and they will considerably leave £30,000 for working capital. Kind folks! What care they if the estates remain undeveloped and unprofitable for lack of adequate capital to work the deposits of asbestos and the 'seams of antimony?' Their exploitation is in the inexhaustible field of credulity which distinguishes the British investors. Let that much-abused class for once abandon its idiocy and be wise. The end of investment is profit—this is an excellent rule; the end of this scheme is the sole profit of the vendors and promoters, *et hoc genus omne*." No authentic information bearing upon the extent and richness of the mineral deposits said to be found upon the two first mentioned properties is to be had, and we are therefore not in a position to speak of their value. The Coleraine property, on the other hand, has been partially opened up, and Dr. R. W. Ellis, in his recent report to the Geological Survey, speaks very favorably of it as a probable asbestos producing property. We understand that in consequence of these disparaging remarks Lord Gifford has requested the Geological Survey to furnish him with full information, and with this object in view it is not unlikely that a special examination of the property will be made.

Largest Producing Gas Well of New York—According to Mr. C. A. Ashburner, the greatest amount of gas ever discharged per diem from any well in the State of New York was from the McMullen and Hallock well, commonly known as the "Mullen Snorter." This well is situated in Olean township, Cattaraugus county. Gas was struck on May 30, 1877, at a depth of 1,180 feet, in a sand bed 25 feet in thickness. The Bradford oil and gas sand proper was struck at a depth of 1,230 feet. From careful measurements on June 1, 1877, the author determined the discharge of gas to be at the rate of 24,480,000 cubic feet per day of 24 hours. With the gas there was discharged about a barrel of oil per day. The discharge of gas continuously decreased until 1882, since which date the well has produced two to three barrels of oil per day, with a comparatively small amount of gas.

The Vancouver Coal Mining and Land Company.

An extraordinary general meeting of the above company was held at the London offices on Tuesday, 5th ulto. Mr. Galsworthy presided, and the proceedings only lasted a few minutes. There were very few shareholders present.

It was stated that the meeting was called as the directors had found it necessary to formulate a scheme for the reconstruction of the company on more convenient lines. The following is the scheme as set forth in a circular sent round to the shareholders: "A new company will be formed to be called the New Vancouver Coal Mining and Land Company (Limited), with enlarged powers and appropriate regulations. The discount shares, other than few which by estoppel have been confirmed, will be specially acquired by the new company in the terms of an agreement already entered into with them, by virtue of which the holders of each discount share will be entitled to 10 1/2 fully paid shares in the new company; the assets and liabilities of the existing company will be made over to and undertaken by such new company; the members of the existing company will receive 10 1/2 shares in the new company for each 10% share fully paid in the present company, and 10% shares with 18s. per share credited as paid up thereon, for each 10% share with 9% paid up thereon in the present company; and the existing company will, in due course, be dissolved." The principal objects claimed to be attained by this reconstruction are: (1) To overcome the difficulty created by the recent decision of the Court of Appeal in *re Almada and Tinto Company*, where it was held that the issue of shares at a discount was *ultra vires*, and to place the holders of such shares in this company in the position which all parties intended that they should stand; (2) to remove the existing difficulties in the way of a declaration of dividend, and (3) to remove any doubt that may exist as to the company's power to sell its entire undertaking to Messrs. Rosenfeld or otherwise.

The chairman moved the following resolutions, which were duly seconded and carried:

"That it is desirable to reconstruct the company, and to transfer the undertaking thereof to the New Vancouver Coal Mining and Land Company (Limited), and with that view thereto the company be wound up voluntarily, and that Mr Joseph Ramsden should be and is hereby appointed liquidator for the purpose of such winding up."

"That the draft agreement submitted to this meeting, and expressed to be made between this company and its liquidator of the one part, and the New Vancouver Coal Mining and Land Company (Limited) of the other part, be and the same is hereby approved, and that the said liquidator be and he is hereby authorized, pursuant to section 161 of the Companies Act, 1862, to enter into an agreement with such new company, in the terms of the said draft, and to carry the same into effect with such, if any, modifications as he may deem expedient."

These resolutions were carried unanimously.

The chairman explained that a call of 20s. per share had been made on the 9% shares; also that a bonus of 20s. per share had been declared on all the shares of the company, both payable 30th April next. This was done to equalize the shares, which would place them on a much better footing than they had been in the past. The reports from the mines were satisfactory, the output for the month of January being 29,000 tons. There was little doubt

Mr. Rosenfeld would purchase the undertaking from the company, and then the shareholders would get about 12% per share instead of about 7% per share if their shares were sold at present. There was no other business.

Silver Wolverine (Limited).

The shareholders of the above company held their first ordinary general meeting on Tuesday, 5th ulto, at the offices, 115 Cannon Street, London.

Major General W. O. Swanston presided. The directors, he said, had nothing to tell the shareholders. There was no report to make and no accounts to present, and at present no dividend for them. He did not know that he had anything to do, except, perhaps, to introduce the directors to the shareholders. Upon the table was some of the stuff that had come out of their property. He might inform the meeting that work had been commenced. They had erected several buildings for the workmen and stables for the horses, and had actually commenced to dig. The last telegram they received from their engineer was dated February 1, and was as follows:—"Wolverine looking well. Sinking by contract in good milling ore." Before that they received a report from another engineer, to whom they wrote on the subject, asking him for information as to the cost, and he concluded his report thus:—"I would say that the Wolverine vein is similar in character to all the best mines in the section, and as far as can be seen you have good reason to expect the Wolverine will develop into as good a property as the Beaver and the Badger." So far as they had gone their condition and prospects looked hopeful.

Mr. Pearson: I should like to ask one or two questions. First, whether it is correct that the directors proceeded to allotment before half the number of shares reserved for the public were subscribed for—that, is, before 10,000 out of the 20,000 shares were subscribed for? Also whether out of that less than 10,000 shares 5,000 were not subscribed for by one man alone? I should further like to know whether, after allotment, the directors sent out to Canada a person to ascertain whether the capital which had been subscribed was sufficient to start with, and, if so, why that information was not obtained previous to allotment?

Major J. A. Winter (director): The amount allotted really is 9,695 shares, and that comes to the same number of pounds, and here is the estimate for the works, which amounts to about 4,700%. That ought to satisfy you, considering we are told that before working a year we shall be paying a dividend.

Mr. Pearson: My next question is as to whether the directors after allotment did not find it necessary to send someone out to Canada to ascertain the amount of money which would be necessary to work the mine, and, if so, why that information was not obtained previous to allotment? (Hear, hear.) My reason for asking that is because I understood when I subscribed for my shares directors who had put their names at the back of the prospectus were fully acquainted with all the information which it was necessary to obtain for the development of the mine. But if it was found necessary after allotment to send out someone, then I suppose the directors did not understand the amount of money that would be necessary.

The Chairman: The first estimate that we had before we took any steps was that it would be about 4,000% for the working of the first year.

To satisfy ourselves that that was right we sent out to an independent engineer for his estimate. His estimate arrived after we had made some of the allotments, and that estimate coincided almost exactly with the one sent before as to amount, except that he included machinery, boats, horses, and waggon, which we had to purchase. These are all the things that we had to purchase the first year, and we shall not have to do so the second year. The whole of that makes a little over 4,000%, and we have 10,000% to work with; and if we make anything at all, we shall make it before we spend 10,000%.

In reply to the question it was stated that working had commenced in the mine.

At the conclusion of the ordinary an extraordinary meeting was held to consider the following resolutions:—"That the following Articles be added to the Articles of Association of the company—Share warrants to bearer: (133) The directors, with respect to any fully paid-up shares, or with respect to stock may, if they think fit, issue share warrants, stating that the bearer is entitled to the shares or stock therein specified, and may provide, by coupons or otherwise for the payment of future dividends on the shares or stock included in such warrants. (134) The directors may determine, and from time to time vary, the conditions upon which share warrants shall be issued, and in particular upon which a new share warrant or coupon will be issued in the place of one worn-out, defaced, lost or destroyed; upon which the bearer of a share warrant shall be entitled to attend and vote at general meetings, and upon which a share warrant may be surrendered, and the name of the holder entered in the register in respect of the shares or stock therein specified. Subject to such conditions and to these presents, the bearer of a share warrant shall be a member to the full extent. The holder of a share warrant shall be subject to the conditions for the time being in force, whether made before or after the issue of such warrant."

The company's solicitor (Mr. Philips) explained that the resolution was proposed in order to give the directors power to issue share warrants, so as to enable the shares to be dealt with. The directors thought it possible that there might be some dealings in the Paris market in the company's shares, and therefore they proposed to take power to issue the share warrants. They had not yet actually decided whether they would issue them. The resolution must be passed by three-fourths of the meeting present.

After some discussion, Major Winter said it was not compulsory for any shareholder to have dealings as suggested. It might strengthen the company, and could not do any harm. Supposing a shareholder went to the Paris market and made a market for his shares, others would be inclined to do the same thing. There would be little expense to the company beyond the printing and registering at Somerset House. The only other expense would be to the individual.

The resolution was carried unanimously.

PHOSPHATE.

WANTED—Large and Small PHOSPHATE PROPERTIES (developed preferred). Address, with full particulars,

J. C. RITCHIE,

Room 31 No. 34 New St.,

NEW YORK CITY.

The Asbestos Industry, 1888.

Dr R. W. Ellis.*

The asbestos industry of Thetford and Coleraine continues to rapidly increase in importance. The formation of the new Bell Company of London during the past season, by which detached areas have been brought under one management, and the wonderful advance in the stock, has incited fresh explorations, and several new openings have been started. Prospecting has been active during the past season, not only in Thetford and Coleraine but in the great serpentine area of Wolfestown, and good indications of asbestos have been found at several new points. But the largest quantity and the best quality of fibre continues to be derived from the Thetford mines, though the very bad season of 1888 has reduced the output very seriously. The asbestos at these mines differs very materially from the greater part of that obtained at other points, both in Broughton on the one hand and in Coleraine on the other. That from Coleraine and Wolfe is to a certain extent affected by a harshness and stiffness which pertains to a very considerable portion of the output, rendering the percentage of firsts much less than at Thetford. The fibre is also for the most part shorter, and much of it, especially near the surface, is discoloured, probably from the percolation of surface waters charged with iron.

Although large areas of serpentine exist at various points in the townships above named, a great part of them are, in so far as explorations have extended, apparently devoid of profitable veins of good asbestos; in some, short-fibred veins of harsh and brittle mineral are found, but these have as yet no economic value, so that the really valuable areas are not very numerous. During the past season all the old mines were carefully examined, as well as the new openings being made during the year. Among these last may be mentioned the Megantic mine, one mile and a half from Coleraine station, first prospected in 1886, but now worked by Fenwick & Scater, of Montreal. A peculiarity of this mine, not noticed elsewhere so far, is the occurrence of considerable quantities of mica in veins with impure asbestos. The rock here is very much shattered near the surface and the fibre is consequently discoloured. Veins up to one inch and a half are found, and in the more solid portions the quality improves. The output from this place has been necessarily small, owing to the time spent in opening the mine and the delays from bad weather, the quantity mined in four months to October 1st being 39 tons, of which one-third may be classed as seconds, the rest as thirds. An average number of 12 men was employed.

Near Black Lake several openings have been made along the track of the Quebec Central Railway by Messrs. Johnston & Lomas. Only three to four men were employed, and the work was of a preparatory nature. The quantity of asbestos obtained was not stated. On lot 32, range B, Coleraine, work has been begun by Capt. Williams. At my visit in October the average number of men employed was 15, and the output to date 29 tons, of which $4\frac{1}{2}$ tons were firsts, the rest about equally divided between seconds and thirds.

In this district also the Bell Company began operations on the north half of lot 28, same range, formerly the Hayden property. Very good surface indications are here visible, many small veins showing, while in the cut

now going in towards the base of the hill fibre an inch and a half to two inches long of good quality is found. The south half of these lots 28 and 27 belonging to Dr. Reed, has lately been sold to the Wertheim's of Frankfort, Germany, who are putting in machinery preparatory to developing the mine. This property is the most elevated of any in the district, being not far from 600 feet above Black Lake Station. The surface indications are here very favorable, veins up to two inches and a half having been found. Prior to the sale about twelve tons were taken from this place, of which two tons were firsts, four seconds and six thirds. It is now being worked by contract at \$25 per ton, ready for market. On the north side of the Poudrier Road, in lots 27, 28, 29, range A, Coleraine, several openings have been made and good indications have been obtained. At the time of my last visit, veins of asbestos up to an inch and a half were seen with a number of smaller ones. On lot 26 also an opening in the surface of the hill disclosed small veins. These areas are separated from those of Black Lake proper, by masses of white granulite and dioritic rock, a belt of which closely associated with the serpentine extends from the shores of Black Lake to the rear of the Thetford mines.

In the township of Ireland on the west side of the great serpentine area, which extends north east from Wolfestown, King Bros. have started two openings on lots 24, 25, range 3. The elevation of these by aneroid is about 500 feet above the surface of Black Lake, which is 200 feet below Thetford Station on the Quebec Central Railway. The asbestos here is found principally in two knolls about one fourth of a mile apart, and occurs at times in a series of thin veins from one eighth of an inch upward, as many as twenty being sometimes found in a space of six inches. Many of these veins show a selvage of whitish weathering serpentine on either side, separated by a thin vein of asbestos from $\frac{1}{4}$ to $\frac{3}{4}$ of an inch thick. Other veins of greater size are numerous, ranging in thickness to $1\frac{3}{4}$ inches; the aspect of the rock and the veins at this place strongly resemble in many respects those on the Belmina property in Wolfestown. The surface indications in so far as visible are excellent, but the mine has not been thoroughly opened, only two months' work with a small force having been spent on it.

At Thetford, new openings have been made to the west of the Quebec Central Railway by Messrs. Ward Bros., by Mr. Johnston and by King Bros. These prove to a certain extent the serpentine area between the present workings and the Thetford river, and good indications of productive ground are found at all the locations, though the lower lying level of the ground may necessitate drainage works.

On lot 28, range VI, Thetford, good indications are found, as also on lot 32, R. C. Coleman, but no work has been done on either of these during the past year. Further north, on lots 16, 17 and 18 in range IV, Thetford, a belt of serpentine occurs which has been opened by Dr. Reed, who reports some very good veins of asbestos. Chromic iron, also, is found in this area, but the samples seen by us seemed too poor in chrome to reach the required standard. Noses of serpentine also occur on lot 13, range V, and on range XI, Broughton, from which asbestos has been reported, but, in so far as yet learned not in such quantity as to be economically valuable. The Broughton mine was also worked during the past season; the vein, of which there appears to be only one, in places reaches a thickness of 3 inches; at others it is split up into a number of thin strings of no

value. The returns from this mine have not been received.

The established mines in all the districts have been working during the past year, though the output has been greatly lessened by the very bad weather, especially during the autumn months. An attempt to obtain the output from each mine has been made, but has been only partially successful, several of the managers neglecting to forward the requisite information in time. Of the Thetford mines, the output of the Bell Company mine, formerly the Boston Company, still far exceeds the others. The shipments for the season to 1st December being 1,350 tons, of which 930 tons were firsts, 105 tons seconds, and the rest waste or thirds. The quality of the asbestos from all the mines of this district is excellent and the price obtained are even higher than quoted in the report of 1886; *seconds* in some cases command \$75 per ton and *firsts* from \$80 to \$110. The output from King Bros.' mine for 1888 was *firsts*, 170 tons; *seconds*, 165 tons; *thirds*, 24 tons. Average number of men employed 32 boys 20. The returns from the other properties are not yet in, but there has been great activity in them all, and the output has been correspondingly large. Rock drills worked by compressed air have recently been introduced at the Bell mine.

In the Black Lake district the principal mines in operation are the Scottish-Canadian the Anglo-Canadian and the D'Auville. Mr. Penhale, the manager of the Scottish-Canadian states that in the eight months ending 10th November, 400 tons were shipped from the mine, of which 40 tons were firsts, 110 tons seconds and 250 tons thirds; but operations were hindered by scarcity of men and bad weather, so that the new workings could not be carried on. This mine is equipped with improved machinery, air compressor, rock drills, hoisting engines and dumping skips, with a new set of appliances for crushing the rock and separating the asbestos, more particularly in regard to the lower grades, to avoid the great expense of cobbing by hand. This machine was in operation but a short time, but is claimed by the manager to be a great success. Should this be the case and the asbestos of short fibre be easily separated, it will largely enhance the profits of the industry, since many of the dumps, most of which now cover very valuable ground, can be profitably worked over and the refuse disposed of for ballasting or other purposes, while under the present system of hand-cobbing, the shorter veins do not warrant the expense necessary for their separation. The Anglo-Canadian mine for the six months ending 15th of November, produced, according to Mr. Hopper, about 210 tons, the average number of hands, including cobbers, being 30 to 35. The principal pit at the mine has been sunk to a considerable depth and Mr. Hopper reports veins at the bottom of very superior asbestos, resembling that from Thetford, from 3 to 7 inches thick. These veins have been uncovered since my visit. The percentage of firsts from this mine has, according to the manager, increased from 10 to nearly 20 per cent. Openings in the face of the knoll to the west of the principal pit are now being worked, the indications here being very good. The output of the Fréchette or D'Auville mine, which lies between the two just mentioned, is given by Mr. Hopper for the season to 1st December as about 300 tons.

The cause of the difference in quality between a great part of the output from the Black Lake mines and those of Thetford has long been a

*Summary Report of the Geological Survey of Canada to 31st December, 1888.

source of enquiry to the mine owners of those places. By some it is supposed to be due to the difference in level between the two places, the workings of the Scottish Canadian Co. being from 50 to 300 feet higher than those of Thetford. Yet this can hardly be taken as satisfactory, since at the Reed mine, 300 feet higher, some excellent fibre is found. A more likely reason may possibly be the driving off of the contained water in the fibre, since asbestos is a hydrous silicate of magnesia, by the action of diorites or the metamorphism preceeding from the presence of the granites, which occupy a considerable area of the Black Lake district. If the soft silky fibre is heated it changes its character at once and becomes harsh and brittle. The serpentine near the contact with the granitic veins or masses is often very considerably shattered as though the presence of the granite had exercised marked influence on its condition. At Thetford the granite masses in the mines are limited to small and thin dyke-like veins, which have not produced any great effect upon the asbestos, but must, however, be said that the stiff fibred mineral is not in all cases confined to the vicinity of visible granitic masses, and other causes may in such cases have produced a similar effect.

Practical Prospecting for Gold and Silver.

The following paper was read by Mr. James Brady, D. L. S., Victoria, B. C., at the annual convention of the Association of Dominion Land Surveyors held last month at Ottawa:

Surveyors in the practice of their profession have many opportunities of examining the rock formation, and ascertaining to some extent the mineral resources of various parts of the country, and, although many members of the profession and of this association are quite as well posted as I am on the above subjects, others may not have given them much attention, and will not object to a few hints that may assist them in determining when they are in a country that may be expected to produce gold, silver, or other ores how to search for the same in an intelligent manner; and how veins may be opened up, in a preliminary way, so as to ascertain as cheaply and quickly as possible the character, value per ton and probable production of ore, thus determining the nature of reduction works required, and being enabled to estimate the cost of mining and reduction plant necessary to work the mine to its full capacity and of the returns and profits that may be anticipated.

It is said that most of the great mines of the world were found by chance and not by regular prospectors. This is probably true as regards lodes and veins, but it must be remembered that until within very recent years the average miner or prospector had little or no knowledge of the rock formations in which gold, silver and other metalliferous veins were likely to be found, and simply roamed over the mountains in a haphazard way, and was as likely to look for gold quartz in cretaceous limestone as in metamorphic slates, or to follow the wrong formation longitudinally as to cross it and get into a better one.

One instance, however, may be mentioned where intelligent observation and persevering search led to the discovery of immense gold fields and the settling up of a great continent—namely, the discovery of gold in Australia by Hargraves in 1851.

Nothing will build up a new country so rapidly as the discovery of gold and silver

mines. Agricultural and manufacturing enterprises are of slow growth, no matter how fertile the soil or how excellent the facilities for successful operation, unless they are given an impetus by something such as the discovery of gold or silver, which will cause an immediate influx of population. When such a rush occurs as is generally the case on the first opening up of a new mining country the work of exploring and development goes on rapidly, and all the resources of the country are developed in a proportionately rapid manner. Lumbering, farming and stock raising enterprises spring at once into existence, as the mines furnish a ready market and good prices for their products.

The old pioneer prospector is rapidly disappearing, and organized prospecting and exploring parties, under the direction of competent mining engineers and experts, are taking his place; and this manner of acquiring mineral properties will be largely adopted in the future as being the cheapest and in every way the most satisfactory manner of gaining possession of valuable mining rights.

The head of such a party starting out to prospect any particular range of country would first acquaint himself with all the geological and other information to be had from the reports of the Geological Survey and other parties who had visited the region of his intended exploration. Failing such sources of information he would take such reports and evidence as he could find relating to the mineral resources, etc., of other districts on the same geological belt or mineral zone, and thus get some idea of where to look for the particular class of ore or mineral desired.

The following extracts from an article on "Mineral Zones and Mountains," from the *Mining and Scientific Press* will help to explain this point:

"One of the plates accompanying King's Exploration of the 40th Parallel is a section of the Warren map of the U. S. Engineer Department. The section given includes the main central region of the great basin, with a part of the coast system of California, and the outlying chains of the Rocky Mountains. A brief study of this map will teach the *one great and prominent law of arrangement of Cordillera Mountain chains, namely, that they trend from north to south, or from north-west to south-east.*"

"In strict subordination to this longitudinal direction of ranges," says King, "are grouped all the structural features of local geology. The average strike of the great areas of upturned strata is generally with the meridian. All the larger outbursts of granitic rocks conform to it as well, since their rents are most commonly the axial lines of actual folds; and, lastly, when the tertiary uplift occurred, its ranges bordered the older mountains in parallelism, and the volumes of lava accompanying it found exit through longitudinal rents, and either built themselves up along the ancient line of structure or through new fissures piled up chains of volcanoes conforming in trend with the general north and south plan."

"Over these mountains are found localities of the precious metals, and it is not surprising to observe that, following its leading structural idea, they appear to arrange themselves in parallel longitudinal zones."

1. "The Pacific coast ranges on the west carry quicksilver, tin, and chromic iron.

2. "The next belt is that of the Sierra Nevada and Oregon Cascades, which upon their west slope bear two zones; a foot-hill chain of copper mines, and a middle line of gold deposits. These gold veins and the resultant placer mines

extend far into British Columbia and Alaska.

3. "Lying to the east of this zone, along the east base of the Sierras, and stretching southward into Mexico, is a chain of silver mines containing comparatively little base metal, and frequently included in volcanic rocks.

4. "Through middle Mexico, Arizona, middle Nevada and central Idaho is another line of silver mines mineralized with complicated association of the base metals, and more occurring in older rocks."

5. "Through New Mexico, Utah and Western Montana lies another zone of argentiferous galena lodes."

6. "To the east again the New Mexico, Wyoming and Montana gold belt is an extremely well-defined and continuous chain of deposits."

From this it can be seen how any information relating to the geological structure and rock formation of a district, or the character of its ores, will assist in determining what may be expected at other points in similar respective positions, on the same range. As an illustration of this I may mention the fact that on the Selkirk range in Kootenay District, B. C., large and valuable lodes of silver bearing lead and copper associated with other base metals, have lately been discovered. The ores of this district correspond in character with those of Idaho and Western Montana, immediately south and on the same range, and with those of mineral zones 4 and 5.

It being a fact that nearly all the valuable gold-bearing veins of the world have been found in metamorphic slates and schists of different ages, from the Silurian in Australia to the Jurassic in California, it is more reasonable, and one is more likely to prove successful, in searching for gold, to confine one's explorations to metamorphic rocks. In like manner all the great gold placers, being chiefly composed of sand, clay, gravel and boulders derived from these and allied rocks, it seems reasonable to prospect for gold placers on the lower slopes and benches of mountains and hills composed of such rocks (particularly where traversed by many quartz veins) and on the rivers and streams draining a country of the above character.

Gold-bearing lodes may be looked for in quartz veins traversing and interstratified with the the softer metamorphic crystalline rocks, such as argillaceous, chloritic, talcose and hydromica slates and schists. Also to a much less extent in granite, gneiss and the harder metamorphic rocks.

The minerals or ores commonly associated with gold, in quartz veins, are iron, copper, lead and zinc sulphurets, and sometimes tellurium; the presence of one or more of these, being considered a good indication in a gold country; and their entire absence as unfavorable to the permanency and regular yield of the lode—even though free gold may be visible in the quartz. The most permanently productive gold quartz mines have been those in which free gold was seldom or never seen, and the above sulphurets were more or less represented.

The quartz is frequently rusty or cellular, and discolored brown, yellow, reddish, blue, etc., by the decomposition of the base ores accompanying the gold.

The most certain and reliable way of finding out if a quartz vein carries gold in paying quantities is to pound up pieces from different parts of the vein and pan them out. If the quartz is pounded very fine and then carefully washed down in a pan or horn, fine particles of gold will be found and can be seen with the naked eye, if there is sufficient in the quartz to pay for working; and it is not worth while

spending much time over a vein (as a gold vein) unless colors can be found in that way. Of course gold is found in paying quantities associated with ores of silver and other metals, as in the Comstock lode, where its presence cannot be ascertained by simply panning out; but this really comes under the head of silver ore, and will have to be assayed in a similar manner.

Veins and streaks of solid arsenical and other pyrites often carry gold in what would appear to be paying quantities, but such mines have seldom been worked successfully.

Silver and its ores are so intimately connected with many of the ores of lead, copper, antimony, zinc, etc., that in indicating the rocks in which we may expect to find silver-bearing veins we necessarily include the others.

Native silver, ruby silver, and silver ores proper, such as are mixed with base metal ores to only a limited extent, are found most frequently in syenite, trachyte, andesite, porphyry, gneiss and allied metamorphic rocks, and in shaly sandstone, conglomerates, etc., in the vicinity of eruptive rocks, and generally in a quartz gangue.

Argentiferous galena, and carbonate of lead carrying silver, argentiferous grey copper ore, etc., in argillaceous shale and schists, crystalline limestone, etc., and porphyry. And low grade argentiferous galena and carbonates in carboniferous and other limestones.

The vein matter, or gangue, may be quartz or calcspar, or both, and may be mixed with heavy spar, flour-spar, or pearl-spar, and in some of the largest and most productive lodes the vein matter is chiefly yellow or brownish clay with boulders of iron manganese rock, and horses of the country rock, and in this character of gangue the largest chimneys of galena and carbonates, carrying silver, have been found.

The character and value of silver ores cannot be accurately determined except by regular assay. They are mixed with so many other ores and minerals that in many cases they cannot be distinguished from the ordinary ores of the base metals. After long experience a man may be able to form a fair estimate of the ores of the particular district in which he has been working, but take him into a new district, where the combinations are different, and his opinion as to the value of an ore, from simple inspection, is quite worthless.

A collection of small specimens of different metallic ores, which can be obtained in New York and readily carried along, will be of some assistance, and with a blow-pipe outfit tests which will determine at least the presence or absence of silver and many of the other metals can be made. These, with "Dana's Manual of Mineralogy," an elementary treatise on geology, and a book of instructions for the use of the blow-pipe, a gold pan or horn and a bottle of nitric acid will enable one to get a fair idea of any ore, rock or mineral, he may come across.

A pick and shovel, hand-crushing machine or pestal and mortar, and one or two rock hammers and small prospecting poll picks should be carried along; and on regular prospecting expeditions, where such things can be packed or carried, a small bellows and anvil, drills, striking hammers, powder, fuse, caps, &c., should form part of the outfit.

In prospecting a given belt of country it is best to cross it as often as possible, and where the rock formation is most exposed, following up the beds of the streams where practicable, and making lateral excursions at convenient points and where the formation seems favourable.

At or near a change of formation, say from slate to granite or limestone, and near porphyritic

or other igneous rocks, in stratified or metamorphic beds, large and productive lodes may be looked for.

Large veins are generally split up or divided into several branches in the valleys or crossings of streams, but the large and solid outcrops can generally be found on the high ridges on either side by taking the general direction of the veins at the crossing, and it is usually on these ridges or hills that the largest and most valuable deposits of ore are found.

Preliminary development.—The first thing to be done in opening up a lode is to ascertain the extent of the ore-body on the surface, so as to determine the best place for a shaft or tunnel. This can be done by sinking to bed rock at several places along the general line of the lode where it is not already exposed, and making cross-cuts at these points. If the mine is to be opened up by means of a shaft it may be located about the centre of this ore-body, and should follow the vein down. The dip of a vein is so liable to change near the surface that a perpendicular working shaft cannot be properly located until prospecting works have been carried to a depth of at least 200 or 300 feet. Drifts or levels should be run about every 60 feet, and where the vein is wider than the drift, cross-cuts should be made at about the same distance apart. The extent to which this work should be carried and the size of shaft, &c., must be determined by the nature of the vein and its ore, the developments made in sinking and drifting and the amount of money the manager has at his command for this purpose. A shaft from 200 to 300 feet deep, and drifts as above, say 120 feet on each side of the shaft, with cross-cuts about every 60 feet, will generally be considered sufficient to decide the probable value of the property and the cost of mining and reduction works for permanent operation.

The ore taken out of the shafts and drifts will help to pay for the work, and the mine will be in a condition to put on men enough to stope out ore while reduction works are building to keep them running while the permanent shaft is being put down.

If the vein crops out on a side hill, or bluff, so that a tunnel can be run along the vein, at a sufficient depth from the outcrop on top, much time and money can be saved, and both hoisting and pumping works dispensed with. But if the strike of the vein is such that the tunnel must be run any distance through country rock before encountering the vein, it must be prospected and proved to a sufficient depth before a tunnel can be attempted without great risk of miscalculation and disappointment.

In lodes that are not too wet, rock and water can be hoisted for the first 100 feet by windlass and from 200 to 300 feet by a whim; but where much water is encountered an engine will be required.

The following points in relation to mining claims should be carefully noted:

1. Location or position on the map.
2. How to reach it, and condition of roads, trails, etc.
3. Course or strike, width and dip of vein or lode.
4. Class of ore or mineral, as nearly as can be ascertained.
5. Quality of ore or mineral, and samples if possible.
6. Length or width of ore body exposed.
7. Gangue or matrix of vein.
8. Character of walls.
9. Country rock.
10. Water-power, if any, fall, number of inches, etc.

11. Quality and cost of wood, timbers and lumber.

12. Cost of labor and board.

13. Price of provisions, grain, hay, etc.

14. Rate of freight from nearest railway station, steamboat landing or town.

15. Distances from nearest railway station, steamboat landing or town.

16. How lode is situated for development by tunnel or shaft.

17. Distance and freight to nearest smelter or reduction works; and rates paid for ore or charged for reduction.

18. Remarks on climate, labor, supplies, grass, etc.

19. Sketch of claim and surroundings.

In closing this paper I will quote the following from a report of the Legislative Council of Victoria, Australia, March, 1854:

"The discovery of the Victoria gold fields has converted a remote dependency into a country of world-wide fame; it has attracted a population extraordinary in number, with unprecedented rapidity; it has enhanced the value of property to an enormous extent; it has made this one of the richest countries in the world, and in less than three years it has done for this colony the work of an age, and made its impulses felt in the most distant part of the world."

Knowing the immense results that have followed the opening up of mines in Australia, California, Nevada, Montana, etc., one would suppose that our Government (both Provincial and Dominion) would offer every inducement to prospectors and miners to prosecute their work of exploration and development instead of hampering them with unnecessary and harassing rules and regulations. The mining laws of all the provinces, and the Dominion, should be assimilated, and many alterations made, and mining machinery which cannot be or is not manufactured in Canada should be admitted free of duty, at least until such time as we can manufacture it ourselves.

The Treatment of Ores.

(Mining Journal.)

II.—Silver Milling.

The ores of silver suitable for treatment by the milling process may be divided into two classes, according to their chemical compositions—viz.: (1) Free milling ores, or those capable of being treated without a preliminary calcination or roasting, and (2) ores which require roasting before amalgamation. The ores suitable for treatment by the free milling process are those containing the precious metal in such forms as are acted on by quicksilver directly, or by the aid of reagents. Ores containing silver in a metallic form may be treated by direct amalgamation, as in the case of free milling gold ores. Other ores of silver best adapted to this process are those containing the metal, as chloride, as kerargyrite, or horn silver, bromide, iodide, and various combinations, with sulphur, whilst in South America ores containing antimony and arsenic are worked by the process, but the sulphides of these base metals, and those of iron, copper, zinc, and lead, if present in considerable quantities, seriously interfere with the process by the fouling or "sickening" of the mercury, and by their reactions on the chemicals employed. The operation is usually performed in amalgamating pans. The process in any case is a slow one and is, generally speaking, only suitable for the treatment of decomposed ores,

or those containing silver in a very free state. Its adoption to the treatment of refractory ores is confined to districts where the cost of fuel is too heavy to permit of roasting-milling. The cost is very high, varying from 40s. to 80s. per ton, besides a lot of silver amounting to from 5 to 20 per cent. of the contents. Roasting-milling is employed on ores containing large percentages of the base metals. Such ores are crushed dry and roasted with salt previous to amalgamation in pans as in the case of free milling ores. The process is rendered more costly than free milling by the additional expense of dry crushing, and the use of the extra agent. Dependent upon local circumstances, the cost may vary from £2 to £5 per ton, but the loss of metal is with careful manipulation only 10 to 15 per cent. of the contents. Where the ores contain zinc, however, the loss would be considerably higher.

III.—Lixiviation.

Under this heading is included several methods of extraction of silver from its ores by the conversion into soluble chloride or sulphate, which is dissolved by water, a solution of common salt, or by other suitable solvents, the silver being recovered by precipitation instead of amalgamation with mercury, as in the free milling and roasting-milling processes. The wet methods are less costly and more rapid than the amalgamation process, but require more skill in working them, especially in the calcining stage. Ores suitable for these processes should not contain large quantities of lead, zinc, antimony, or arsenic, while the presence of either cuprous, sulphide, or iron pyrites is necessary to produce the reactions of the roasting stage. The great skill required in this stage of the process militates against the adoption of the process except in well appointed metallurgical works. The cost varies from £3 to £6 per ton, or even higher where the quantity of ore treated is small, but the loss is comparatively small.

IV.—Concentration.

Whatever process may be most suitable to a given description of ore, a preliminary treatment in many cases will be necessary to remove the gangue and earthy constituents of the ore. The degree to which this concentration should be carried depends upon the nature of the gangue, the characteristic distribution of the metallic portions, and the process which has been selected for the subsequent manipulation of the ore. Under these classifications concentration may be divided into two classes—fine and coarse concentration.

Coarse concentration is applicable to ores in which the heavy minerals, such as those of lead, zinc, iron, and copper, are distributed in masses through the gangue, and in which a rough concentration is sufficient to separate the mineral. The ore is first crushed, and afterwards sized by passing through a series of graduated sieves, and as the success of the operation depends in an absolute degree on the perfection of this classification too much care and attention cannot be bestowed on it, each size being treated on a separate "jig." The "tailings" or waste from the jigs frequently contain particles of ore with mineral attached which has not been detached in the first crushing; such tailings should be re-crushed, but the thoroughness of the operation in this respect would naturally be regulated by the margin of value contained in the imperfectly crushed ore after allowing for the additional cost entailed by re-crushing. The slimes require to be treated by distinct machinery, such as revolving buddles, as employed on tin ores in the Cornish mines; by Rittinger tables; or by the more modern "vanning" machines of Amer-

ican invention. Slimes which have been enriched by the addition of brittle minerals of the precious metals, occurring with the base metals, such as ruby silver ore, and various tellurides, will require extreme care in their manipulation. To prevent loss in dust, wet crushing should in all cases possible be adopted.

Fine concentration will be necessary in all cases where the mineral is disseminated in fine particles throughout the gangue rock, and where coarse crushing is inadequate to separate the mineral. As in the case of slimes from coarse concentration, machines adapted to the treatment of pulverized ore are necessary, the most common being revolving buddles, Rittinger tables, or vanning machines. Ores containing galena, blende, silver glance, tellurides of gold and silver, grey copper, iron, and copper pyrites in fine state of division may all be successfully concentrated in this way, with the exercise of care. The process is suitable for low grade silver ores, provided they are not chlorides, or decomposed ores, which are best treated by the free milling process. It is not adapted, however, to carbonate ores where the mineral is disseminated in fine films or mere discolorations through the rock. In the Lake Superior district silver ores containing only 6 ounces of silver to the ton are profitably treated, and the concentrates shipped 600 miles to a smelter.

The subsequent treatment of the products from either coarse or fine concentration must depend on the description of ore operated on, but in most cases where smelting facilities are within reasonable distances it will be found preferable to send the ore to the smelting establishment.

Transmission of Power Through a Bore-Hole.

Mr. Wm. Hall, Manager of the Spring Hill (N. S.) mines, gives the following account of the successful completion of a winding plant, situated on the surface, and hoisting from an underground slope:

One of the most noteworthy improvements made at Springhill collieries for some time past is the successful introduction of a new system of underground haulage, for winning coal.

To place engines underground has always been a source of annoyance and danger to the workmen. The air is excessively heated, and the roof more or less affected, sometimes disastrously by reason of the hot air, and escaping steam operating upon the air courses, where there is fire-clay, loosening it so that there is pieces falling continually.

The North slope is sunk 800 feet down to the working levels. From this slope from seven to eight hundred tons of coal are raised daily.

This seam of coal has also been tapped 500 feet to the deep of the North slope, by means of a tunnel driven through the intervening strata, between the north and south seams, a distance of eight hundred feet. This tunnel was started from the 1300 foot level in the West slope. The coal from the 500 foot lift in the north seam will be taken through this tunnel and hoisted up the West slope.

A bore-hole four inches in diameter has been put down from the surface to the bottom of 1300 foot level (North slope) a depth of 600 feet perpendicular. An engine and boiler have been placed in position on the surface close to the bore-hole. Power is then transmitted by means of a wire rope, and an arrangement of pulleys at the top and bottom of the bore-hole. Beside the wire-rope in the bore-hole is placed

a signal cord. By means of this cord communication is kept up between the engine-men and the man at the bottom.

A slope which is to be 750 feet deep has already been started on the 1300 foot level at the bottom of the bore-hole. It will be sunk at the rate of 200 feet a month. The coal taken out of this slope will also be brought through the tunnel previously mentioned, to the West slope. When the slope is completed and opened out, the coal will be hoisted up the North slope to the surface a distance of 2,000 feet.

This method of working coal will enable a large body of coal to be won twelve months earlier than it could possibly be done under the present circumstances. The placing of an engine on the surface obviates the conducting of steam in pipes a long distance, with all its attendant injurious effects upon the workings. The mine is kept perfectly free from hot air and steam.

The first cost of the bore-hole is not nearly so great as that of 1800 feet of steam pipes, while the cost of repairs, where pipes are suspended from the roof by means of hooks, will be entirely saved. Other repairs necessary to prevent leakages in the pipes will also be obviated, thus effecting a very material annual saving.

This I believe, is the first experiment of the kind in Nova Scotia—or in the Dominion.

Canadian Asbestos Co.

Many Canadian and American capitalists are interested in the affairs of the Scottish-Canadian Asbestos Company. The company has been in liquidation in Scotland for some time and periodical cablegrams marked the progress of proceedings. A notice was published in Scottish, Canadian and American newspapers, calling a meeting of all creditors and contributories of the company at Arthabaskaville, at 2 o'clock on Tuesday the 19th instant. An impression appears to have been formed among American and Canadian stockholders that an old country clique was formed to gain control of the mines. Mainly owing to mismanagement the affairs of the company have been in a bad state for some time. A few of the English creditors came to an arrangement with the company's directors whereby they advanced \$15,000 for the working of the concern. By this means they aimed at securing predominant influence, and standing for a privileged claim and a guaranteed interest-revenue from the proceeds of the works. Then they put the company into insolvency. The notice advising intention of this action only reached this country after the Scottish courts had granted the petition and appointed curators.

The meeting of creditors called for 19th inst. was to have discussed the position of the corporation. Mr. Guerin, of Messrs. Greenshields, Guerin & Greenshields, went out to Arthabaskaville on behalf of a number of Canadian and American creditors, representing some \$195,000 of the company's stock. He was instructed to fight the petition for putting the concern in liquidation, but the judge before whom the case was to come was sick at home and no court could be constituted. Attorneys for the liquidation party asked Mr. Guerin to register an appearance, but he would not, so that now the case in forensic phrase "by the intervention of Almighty God" is quashed. During the six or more weeks it will take to bring forward the case again, all proceedings having now to be gone over again, Mr. Guerin and his clients will have time to prepare a definite line of action.

PHOSPHATE.

In General.

A good deal of interest has been awakened in England in the Canadian phosphate industry and if judicious selections of properties are made the investment of capital will redound to the benefit of both countries.

Market.

Canadian phosphates appear in good demand abroad, and the market may be quoted at 9d. for 70%, 10½d. for 75%, and 11½d. for 80%, all with one-fifth per unit rise.

Du Lievre.

On going to press, we learn that the properties of the "Société de Phosphates de Canada," in liquidation, have been suddenly acquired by European capitalists. The property comprises some 5,000 acres of phosphate lots, chiefly in Portland West, and of which the Baisson group is acknowledged to contain a rich deposit.

Reports concerning the North Star continue to be exceedingly satisfactory. A splendid show at the No. 2 pit (the only one at present being worked) is yielding regularly and easily 800 tons per month with few men. The completion of the new wharf under construction will probably be retarded by the early collapse of the river road for sleighing.

The output of the High Rock mines for the month of February is reported to have been fully 1,000 tons; this is a record for these mines. Ample preparation is being made for a busy season.

There is nothing special to report from the Emerald or Little Rapids mines.

At the Canadian Phosphate Co.'s mines, the Beaver Meadow boiler house was totally destroyed by fire on the 5th instant. The loss, however, has caused no serious delay of the works, for the energetic superintendent, Mr. Lainson Wills, had the engine running before noon on the following day, and a new house constructed in twenty-four hours. The new car track has been kept running without difficulty all through the winter. The pier at Crownhill has been completed, and by appearances may be taken as a model of an inexpensive and yet efficient means of readily loading the scows. Six tenement houses and a general house for manager, and office, will be immediately added to this part of the company's property. Two new scows are also in construction. The various pits are all looking well.

The winter which closed up so unexpectedly in this place, promises to give an equal surprise for early navigation. Those who have their ore above the Little Rapids may well have some anxiety on the score of getting their scows past this obstructed part of the river should not the Provincial Government render some assistance. It is evident that something in the shape of a steam winch on float will be required to draw the scows up the channel. We would suggest that the miners organise and send a deputation

to Quebec to insist that something should be done to facilitate the shipment of ore at this point.

Mr. C. W. Spencer, Assistant Superintendent of the C. P. Ry., visited Buckingham on 21st to meet the representative of the phosphate and mineral companies with a view to having more satisfactory means of transshipment from the scows into the cars than at present exists. As pointed out in our last issue there is an urgent necessity for the erection of elevated bins and extra sidings to meet the requirements of the industry.

Templeton District.

Mr. C. Lionais, formerly superintendent of copper and asbestos mines in the Eastern townships, is reported to be making elaborate preparations for commencing work on some lots adjoining the Blackburn estate. Telephone communication to the station, electric light and a costly plant is said to be in course of erection. Perhaps it might be well to ascertain and prove the true value of the property before going to all this expense. Extravagance and illadvised management has in the past wrought enough harm to our Canadian mines, as a number of properties with which Mr. Lionais is not unacquainted can testify.

Mr. Robert Blackburn informs us that the new works at his mine continue to progress satisfactorily.

The Templeton & Blanche River Company are negotiating with English people for the transfer of their property.

Perth District.

The Anglo-Canadian Phosphate Co. report a continuance of the favorable operations at Otty Lake and Bobb's Lake mines, and will have about 1,500 tons of phosphate ready for shipment at the opening of navigation. It is expected that the force of miners will be largely increased after the spring thaw is over, as several deposits have been opened.

Kingston District.

J. Foxton, of Sydenham, has fifteen teams hauling phosphate down to the lake. Notwithstanding the inclemency of the weather, 100 tons were laid down last week. The mine still looks remarkably well; the more depth attained the larger the body of apatite.

Remarkable progress of a South African Gold Mine.—The hitherto comparatively unexplored district of Witwatersrandt having been prospected is now producing results as sensational as were experienced in the days of the Australian gold fever, and those results will evidently be supplanted when enterprising speculators have gone further afield. During the past year no fewer than fifteen hundred stamps have been laid down at Witwatersrandt, thus bringing up the total number to two thousand; and further extensive engineering works are being carried out to meet the exigencies of a development in mining that is truly phenomenal. A sufficient illustration of this development is found in the yield of the Robinson mine, which, with a ten-stamp battery, had a crushing in November of four thousand ounces. It can, therefore, give rise to no astonishment that a 20s. share in this mine has now reached the extraordinary value of £64. Such a figure is, of course, exceptional, though the shares of other companies command a very high premium.

MINING NOTES.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

NOTICE.

At the Annual Meeting of the Gold Miners' Association of Nova Scotia, held at Halifax, on 6th instant, a resolution was passed adopting the "Canadian Mining Review" as the official organ of the Association. Our readers may therefore rely upon the accuracy of all information published in these columns bearing on the gold mining industry of the Province.

The annual meeting of the Gold Mining Association of this province was held at the Halifax Hotel, Halifax on the afternoon and evening of Wednesday, 6th March. A large amount of business was transacted, and some important changes in the by-laws were made. The retiring officers were re-elected but as these gentlemen declined to take office again, a fresh ballot was taken with the following result: President, B. C. Wilson, Waverley; Vice-President, G. W. Stuart, Truro; Secretary-Treasurer, J. H. Townsend, Tangier; Committee on Publication, Messrs. J. E. Hardman, T. R. Gue, John McGuire; Committee on the Mining Law, Messrs. F. B. Wade, J. M. Reid, J. H. Townsend. It is gratifying to note that the membership is growing rapidly and a Bill to incorporate the association with a capital of \$10,000 is now before the Provincial Legislature. The association meets a long felt want in the province and it has thus far had a very considerable influence for good upon the industries.

Darr's Hill District.

The Dufferin mine was sold at public auction in Halifax on the 14th. It was knocked down, after spirited bidding, to Peter McGregor Archibald for the sum of \$141,000. Mr. Archibald bought the property for a syndicate comprising A. K. Archibald, the Administrators of the estate of the late Capt. E. Archibald, Timothy Archibald, G. A. Leslie, Annie Dixon, widow of the late Henry Dixon, and George W. Stuart (all of whom were previous owners) and Gardner Clish, of Truro, N. S. The sale was therefore virtually that of the one-quarter interest hitherto held by Charles F. Mott, of Halifax, N. S. The syndicate contemplate incorporating as a stock company at an early date; meantime work at the mine is going on continuously.

Moose River District.

The new water-power stamp-mill erected for Mr. D. Touquoy has been crushing for ten consecutive months and gives entire satisfaction. The product for February was about \$1,700. Mr. Touquoy continues to crush his surface gravel and boulders with uniform results and with a profit. The material averages \$1 per ton in gold, and the total expense of handling and treating the same varies from 35 cents per ton in summer to 40 cents per ton in winter. The supply of this material is said to be very large. Mr. Touquoy is also working a lode yielding about one-half ounce to the ton.

Oldham District.

Work on the Standard Gold Co's. property is being pushed this month. A new level has been started to the east at a depth of 350 feet and the corresponding level will be commenced as soon as possible. Slopes 12 and "B" are working with a full compliment of men, and the main shaft has been cleaned out preparatory to sinking. The east shaft has now a total depth of 368 feet, and the quartz in the bottom looks better than at any other point below the 350 foot level.

The Oldham Gold Co. have stopped work in their No. 3 shaft, Baker Vein, owing to the poor prospects held out by the work already done. The vein seems to have pinched out altogether in the bottom of this shaft. In No. 5 shaft but little work is doing, the vein here being only a seam. Only the 400 foot level south, and the 275 foot level south being worked. No stopping has been done for some months on account of the low grade character of the ore so far met with.

Renfrew District.

The manager of the Empress Gold Mining Co. expects to drop ten stamps in the new mill within a month; the other stamps will not be put in just yet. Considerable quartz is on the dump, and a large amount broken below. The shaft is down about 300 feet, but is not now sinking. The average of the ore is said to be about \$12.

On the Free Claim property development work is being pushed. From the shaft on the Brook lode a cross-cut is driving to the south, which has already cut three lodes, one of which shows well in free gold. A level is being driven on the lode preparatory to stopping overhand. There is a large amount of ground opened up on the Brook lode, and stopping has been already begun.

The example of the manager, Mr. E. C. McDonell, in adopting the system of driving levels and back-stopping is worthy of imitation by all our gold miners, and in this particular case we can see the effect of a little leaven "which leaveneth the whole mass."

Waverley.

The work of widening and retimbering the 360 foot shaft on American Hill is slowly but surely progressing. About 260 feet have been timbered to date leaving only 100 feet more before active sinking operations can be commenced. The surface plant is said to be the finest in the gold districts of the Province.

Crow's Nest.

A small amount of prospecting is going on at this mine, and the owners propose to do considerable development work this summer. The property geologically is an exceedingly interesting one, and its advantageous position for cheap extraction is rarely surpassed.

Pictou and other Districts.

The coal trade in Pictou County is at present in a more depressed state than it has been at any time since the close of navigation. This is more or less general at all the mines with perhaps the exception of the Black Diamond, at which a steady local trade is as usual being carried on. At this place the work of driving the drift through hard rock to the underlying seams is still pushed forward with vigor.

At the Acadia Colliery there has lately been a great deal of broken time but most of the workmen are retained, and they get a fair share of what work there is.

The depression is perhaps more keenly felt at the Drummond Colliery, and in consequence a large number of men are out of employment. There is, however, quite a number of hands regularly employed, and the number is being increased whenever circumstances will permit.

The operations carried on just now are entirely of a preparatory nature, rendered necessary by the adoption of a different method of working the new lift that is being rapidly opened up to meet the requirements of the summer trade.

At the Albion Collieries mining operations are also affected. The important re-opening of the works so frequently referred to in these columns is still being pushed forward with a determination well worthy substantial reward. Your correspondent hopes to report at early date that the long closed pits have been successfully opened and worked.

Rumors of the starting of the much talked of iron works have so long been rife that little or no interest is now taken in any report that is heard. It is difficult to understand why some kind of works have not been put up long ago in such a favorable locality, unless it be that capitalists hesitate to invest in consequence of the poor success of the steel company at Londonderry.

The following official statement shows the revenue derived by the Province from coal royalties during the past three years :-

	Cape Breton.	Cumberland.	Pictou.	Other Counties.
1886	\$44,210.80	\$30,534.90	\$26,894.38	\$16.45
1887	64,066.82	31,391.82	24,211.52
1888	63,608.45	28,309.36	32,853.75	4.50

Cape Breton.

Dr. E. D. Peters, jr., left Boston on the 13th inst., in company with General Manager Gragg of the Eastern Development Company, to visit the property of the company in Cape Breton. During the trip, Dr. Peters will arrange the final details of his plans for the smelting works of the company, on the large scale which the development of the mine seems now to fully warrant. The last reports from the mine show the work in ore body to be progressing well;

main shaft 226 feet, and the slope on vein B now 44 feet, and holding the same breadth from the bottom. The south cross-cut is now passing through strongly mineralized rock.

Quebec.

Mr. E. Wertheim has returned from Europe and is at present at his asbestos mine in Coleraine. The results of the work done during the winter have been very satisfactory, although only a small force have been at work. Mr. Wertheim is making preparations for enlarged operations to be commenced as soon as the snow leaves the ground.

Mr. W. H. Walker is making many improvements on his graphite property, near Buckingham. Several substantial new stone buildings have been put up, and everything is being put in good shape for the recommencement of mining operations.

The Excelsior Copper Company's mines are reported to be working to the satisfaction of the owners. We understand that the shipments are fairly regular and of good quality.

The Thetford Asbestos Mining Company are applying for letters of incorporation. The capital stock is placed at \$20,000, the number of shares, 2,000 of \$100 each. The names and addresses of the applicants are: Arthur H. Murphy, Montreal; John T. Wilson, of Montreal, merchant; William S. Patterson, of Montreal, merchant; Robert W. Patterson, of New York; Henry C. Eno, of New York, physician, and John C. Eno, of the city of Quebec; of whom Arthur H. Murphy, William S. Patterson and John C. Eno are to be the first directors of the said company.

Mr. A. M. Evans, M. E., Cardiff, Wales, of the well known firm of Blakemore & Evans, has sailed for Canada. He is interested in asbestos and antimony in the Eastern Townships.

Ontario.

The Wahnapiatae Mining Company will put in some machinery at their Sudbury properties, and do preparatory work as soon as the snow leaves the ground.

Preparation is being made to open up and work the Guinea gold property, in the township of Kaladar. The owners are: Dennis Guinea, John Guinea and A. P. Wickware, of Kaladar; Rev. Father O'Donoghue, Erinville; F. Burrows, H. M. Deroche and J. H. Downey, Napanee, and R. A. Helliwell, of Chicago. A crusher has been completed and a large quantity of ore hauled out already for use. Thirty tons of ore will be crushed per day, and it is expected the yield will be from \$7 to \$10 per ton, or even \$15 per ton.

As announced in another portion of the REVIEW, it may be taken for granted that Ottawa will be the meeting place in October of the American Institute of Mining Engineers. A large and influential committee is being organized to carry out the arrangements, towards which the Federal Government and the Provincial Legislature of Ontario have made grants of \$1,000 each. An effort is being made to secure a similar sum from the Province of Quebec. It is also proposed to raise an additional \$1,500 by private subscription.

It is reported that American capitalists are organizing a syndicate to convey gas to Detroit from the gas well recently discovered at Kingsville. The reports from the new well are said to be satisfactory.

Port Arthur District.

The Provincial Government has decided to aid by a grant the proposed Port Arthur smelting works. This has given great satisfaction to the miners.

The Government has also granted a bonus of three thousand dollars per mile for fifty miles to the Ontario and Rainy River Railway Company. It is thought that this will make certain the construction of a railway through the rich mineral country west of Port Arthur, satisfy Fort William, and give general pleasure to the whole district.

The Supplementary Estimates contain a grant in aid of the Whitefish Valley wagon road.

Owing to our Correspondent's letter having miscarried we regret to be unable to furnish our usual budget of news from this region. All the mines however are working briskly, and yielding satisfactory outputs. A number of rich strikes, particularly at Silver Mountain, are reported.

Developments on "Silver Wolverine" so far consist of two openings, Nos. 1 and 2 shafts, the former being down to date, 20th ult., to depth of 42 feet from collar. This work has been carried out by contract labour. The location is traversed by two strongly defined and well mineralized lodes, the gangue of which is chiefly composed of flour, calc, quartz and heavy spar, carrying in addition to leaf and black silver the usual argentiferous black blende and fine grained argentiferous galena peculiar to this district.

No. 2 shaft is but partially opened on outcroppings of vein at a point 600 feet east to No. 1, and on the same lode, and so far as development has gone in this direction the vein matrix is of the same class as No. 1.

From collar to bottom both walls are well defined and slickensided throughout. Trap however to the 40th foot has been the prevailing rock, but at the 41st foot a change became apparent, and an increase of silver occurred, and the black or silver bearing slates begin to appear on the foot wall; at this point the vein measures 4 ft. 2½ ins. in width, with a pay streak of ore averaging 22 inches in width.

Surface improvements on this mine consist of stable, blacksmith shop, powder magazine, sleeping camp, shaft house, and one large substantial boarding and dwelling house combined. A large store house is also nearing completion. The buildings enumerated are ample for the requirements of the mine, and their value is estimated at \$2,500.

The Wolverine Mine is situate to the immediate east of the "Queen," on the north shore of Whitefish Lake. The location contains nearly 80 acres. The located line of the Port Arthur, Duluth & Western Railway, part of which has already been contracted for, passes through the property.

The Wolverine is well wooded with timber suitable for building and mining purposes, while its elevation above the lake affords facilities for economical mining seldom met with.

Manitoba and North-West Territories.

Mr. Thomas Mitchell, jr., of Toronto, is at Medicine Hat with the sole purpose of having a shaft sunk on the Medicine Hat Railway & Coal Company's lands a few miles west of that place.

Letters patent have been issued incorporating David Hyslop, of Killarney; G. Crowe, W. H. Hastings, Thomas H. Preston and Colin H. Campbell, barrister, the last four of Winnipeg, under the name of "The Manitoba Coal Company, Limited," for the purpose and with the object of mining and extracting coal in the Province of Manitoba. The district to be opened lies about 15 miles south-west of Deloraine.

It is reported that Lieutenant Cochrane has organized an English company with a capital of \$1,000,000 to develop the coal beds in the vicinity of Cochrane, N.W.T. Lieutenant Cochrane is expected home from England this month.

British Columbia.

The miners employed by Messrs. Dunsmuir & Sons, of the Wellington Colliery, now working at what is known as the Sabiston and Horne Mine, have opened into a seven-foot seam of excellent coal. This property is in the famous Millstream Valley on the Nanaimo side of the East Wellington property, and the work of opening it up will be prosecuted with the utmost vigour. Quite a number of men are now engaged at this work.

At a recent meeting of the shareholders of the Canadian Anthracite Coal Co. held at St. Paul, it was decided to continue the present contract for supplying the whole output—which amounts to 100 tons a day—to San Francisco merchants and to renew the contract with the miners for mining the coal and placing it on the cars. The difficulties between the company and the Canadian Pacific railway company have been satisfactorily adjusted and the working of the mines will probably continue unchecked. The whole output is to be deposited at San Francisco and no attempt will be made to supply eastern markets. Improved machinery has been erected at the mines and the coal is now turned out in regular sizes, screened and free from shale. Some new seams are being opened just east of the present workings, and another colliery will be started shortly.

Despatches from Field, under date of 13th, state that between thirty-five and forty men employed at the Monarch mine were discharged to-day, but as none of them appear to have received the slightest explanation it is not known why, or for how long, work will be suspended. It is reported that the company's smelter at Vancouver has proved incompetent to handle this ore, and that about two months will probably elapse before the necessary alterations can be made. The British Columbia Smelting Company therefore do not require any more ore at Vancouver just now, and it is not convenient to have any quantity accumulate here. It is to be hoped that active operations will be resumed at the Monarch immediately the smelter is in working order as the successful working of this mine would be of much benefit to the neighborhood, and its failure very discouraging.

The latest report, dated the 19th inst., states that the Mount Ceniz Tunnel, Perry Creek, is now driven in 616 feet. Ten experienced miners are working day and night shifts, and besides these other men are constantly employed

hauling timber and sawing out lumber. The result of last month's washing was 80 ounces gold of the same quality as the 60 ounces previously received, which, assayed at Selby's Smelting works in San Francisco, yielded \$18.50 per ounce. The pump and machinery intended for the company's shaft, distant six miles from the tunnel, is still lying at Cranbrook. With the beginning of spring (the present temperature at Cranbrook is 12 degrees below zero) it will be moved and work commenced on this portion of the company's ground.

It is reported that when the price of coal went up the wages of all miners on Puget Sound were advanced 15 per cent. on the stipulation that if the price of coal went down wages should be lowered as much as they had been advanced. During the past few months the price of Seattle coal has dropped from \$10 to \$6 in the San Francisco markets, the supply being so much greater than the demand. Owing to this drop in prices the coal companies now claim that at the present prices coal cannot be mined and marketed so as to leave a fair margin of profit. To meet this exigency meetings have been held by the mine operators, and a reduction of 15 per cent in the wages of miners has been determined upon. Just when the reduction will go into effect has not been definitely determined upon, but it will not be longer than a few days.

The *Colonist* says: Col. Baker has received intelligence from the mine on Perry Creek to the effect that \$1,440 had been taken out of the tunnel for the four weeks ending 17th February; \$400 of that sum in the last week. The canyon has narrowed down, and bedrock is flat, and the evidences are that the end of the canyon is about reached. When once rough bedrock is secured it is thought that large quantities of gold will be taken out. Every day may bring news of a big strike.

A Big Blast.—On 25th ult., five tons of powder were exploded in Schneider's granite quarry, at Graniteville, Mo., and the force upturned a mountain of granite fifty-two feet in the air. The shaft was sunk 100 feet in solid granite, and the chambers were thirty feet long, cut on each side of the shaft. The powder was packed in close. About one hundred people witnessed the great upheaval from a safe position. The concussion was terrific, and the windows in houses for some distance were broken. Blocks of granite weighing 100 tons were tossed in the air.

A Remarkable Well.—A remarkable well was completed on Tuesday at the Mabel furnace (S. Perkins & Co. proprietors), Sharpsville, Pa. It is a shaft 11 by 13 feet and 84 feet deep, and furnishes clear, pure, soft, cold water at the rate of from 25,000 to 30,000 gallons, or over 100 tons, an hour. The workmen passed through 15 feet of surface, and then through 40 feet of blue clay, when they struck sand and gravel, evidently the bed of an ancient river. Water was first found at a depth of 74 feet, but the shaft was pushed on down 10 feet further, when the rapid inflow forced a cessation of further operations. It was sunk under the efficient supervision of Mr. M. W. Jenkins, mining boss of the New Virginia Coal Co., and took about two months.—*Colliery Engineer*.

Canadian Mining Companies in England

General Mining.—Accounts to December 31 submitted in April, an interim meeting is held in November. Dividend for 1884, 5 cent; for 1885 and 1886, 3½ each year; and for 1887, £4 13s. per cent. Reserve fund, £29,850.

Low Point.—The vendors' shares, up to the end of 1888, do rank for dividend until 7 per cent. per annum dividends have been paid on ordinary. Accounts to Dec. 31. For 1887, 5 per cent. paid on the ordinary shares other than those held by the General Mining Assoc., that Company foregoing their dividend rights.

North-Western Coal.—The deferred shares receive on dividend 15 per cent. per annum (cumulative) has been paid on the ordinary. Accounts to June 30. Dividend for 1887-8, 5 per cent.

Sydney and Louisburg Coal.—Accounts to Dec. 31 submitted in May. Out of the profits of 1884 one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,574.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200, reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £450,000; purchase consideration, £400,000, in cash or ares. Fully-paid shares issued to the vendor; partly paid to the bid.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital £100,000, of which £80,000 was the first issue. Most of the ares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1885. Accounts to October 31 submitted in March. No dividend yet. Debentures, £3,450. Reports are not obtainable, at this information is official.

Anglo-Canadian Phosphate.—The preference shares rank first 7 per cent., and after a like rate has been paid on the deferred ares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Asbestos and Antimony Company, Limited.—Registered March 2, 1889. Of the capital as above, £50,000 was issued the vendors as fully paid, and the remainder was allotted to the public, £3 being payable on application and allotment, £1 one month after, and the balance two months after.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £2,576, which was carried forward.

Something About Coal Mining.

C. T. MAGRATH, D. L. S., LETHBRIDGE.

There seems to be a prevailing idea among a great many that the extraction of coal is a very lucrative business, one which require little capital for development, and yielding immense profits.

One of the sources occasioning this error is doubtless the fact that seams of lignite and coal are very often visible in the outcrops along the valleys of our rivers, and to those contemplating the working of any of these seams I presume the two principal factors entering into their profit and loss statements would be the contract price paid to miners and a trifle for transport to markets, leaving a very large margin up to the selling price, to the consumer. For the proper development of a mine, the first consideration of the operator is a thorough examination of the coal area to be worked out, and a Diamond Drill, though somewhat expensive, is probably best adapted for this work, owing to its withdrawing a "core" from the different measures passed through. The general dip of the seam may then be obtained and shafts and surface works so located as to give the best combined results for the future development of the mine—for instance, underground drainage, also underground haulage with respect to grades. Seams of coal may be found dipping from 0 to 90 and the nearer a horizontal position the easier worked, for several reasons; one I might give, is the adaptability of such a seam for the introduction of mining machinery, of which I will speak later on. Rarely, however, is a seam found to remain level for any distance, being more or less undulating. Dipping seams, especially when they approach a vertical position, are often very uncertain, as in this position the seam may be most "faultry." I have seen in the mountainous regions of Southern Montana, abandoned coal mines, where, in one case, probably five hundred thousand dollars were expended in developing a vertical seam, to find that the coal ultimately disappeared. The percentage extracted of the total amount in the seam, varies from 50% in some mines to 80% in others, and depends altogether upon the character of the roof. In many instances in a mine with a soft roof, unfinished chambers have to be abandoned on account of the roof coming down, leaving buried large tracts of coal which it would be too expensive to reclaim.

Props for the support of the roof are quite an item in cost of production, and as the mine becomes developed the percentage of timbering increases, owing to the "entries" or arteries through which the coal is hauled, daily becoming longer. In addition, these entries require constant attention in the renewal of timbers. Then again in the chambers, the props are rarely reclaimed unless in mines where the roofs are composed of good strong shales or sandstone.

The manner of mining the coal is governed to a certain extent by its physical conditions. If the roof is very good, the system of long-wall work may be adopted with advantage. In this system a long continuous face of the coal is exposed and by propping the roof along this face, sufficient room is secured for the workmen, behind whom the roof keeps giving away as the work advances. The necessary roads through the workings are usually supported by masonry.

The other method of mining the coal is by "pillar and room" or chamber workings, which to be applied in different seams, requires changes and modifications, depending upon the nature of the roof. Under this system we have what

are known as "Double Entries," which consists of two passages, each about 8 feet wide, and driven parallel with a pillar of coal between them varying in thickness from 15 to 20 feet. From these, chambers or rooms are laid off, leading to the right and left from the respective entries. These rooms are driven 9 feet wide a distance of about 15 feet, when they are widened out to various widths consistent with the quality of the roof. Usually, however, with a fair roof, rooms 27 feet in width may be driven the full depth required, before the superincumbent mass is likely to come down. The locating of the rooms along the side of an entry depends upon the maximum width of room after it turns the pillar, i. e. where the width is increased after driving the last 15 feet. Provision is made so as to leave a pillar of coal about 12 feet in width between each room, running its entire length from which the coal is extracted backwards to within 15 feet of the entry, after the room has been driven the required length. By this means solid pillars of coal of about 15 feet in length by various widths may be found along one side of the entry and separated by the 9 feet entrances to rooms either worked out or under process of extraction, while the opposite side, with the exception of cross-drifts for air or roadways, is one continuous pillar of coal, separating the two entries. These pillars are left for the purpose of supporting the roof, and though 15 feet is mentioned herein as the usual distance pillars extend back from the entries, yet this does not follow in all mines as the dimensions of pillars for the support of roofs depend entirely upon the depth of stratification overlying the coal. "Double Entries" are necessary for ventilation. If the workings are on an extensive scale, the ventilating current is by mechanical means forced through one entry up to near the "face" or end of that entry, supplying on its way the several rooms, then passing through a cross-drift, the other entry is converted into a return air-way. As the entries are driven forward, these cross-drifts are closed up and new ones cut near the face, so as to ventilate the more advanced portions of the workings. Should it be found necessary at any time to abandon any particular set of entries, the pillars then standing may be extracted backwards from the face.

Some coals are much harder to cut than others, and owing to certain seams having a distinct cleavage, with faces regular and parallel, the coal is much easier cut by working on or against the faces, making it therefore necessary to drive the entries on or against the "butts." This is especially the case with the lignites and bituminous coals of North-Western Canada. The maximum depth of the rooms or distance between sets of entries is variable in different mines and the management in defining this distance, is governed by the quality of the roof, and also by the greatest distance it is desirable to make miners shove their mine wagons out to the entry, from which point the wagons are afterwards hauled to the shaft or other outlet by means of either horses, mules or machinery. Rapid stides have of late years, been made in the improvement of machinery used in connection with collieries, such as hoisting engines, coal-cutting machines, drills, mine waggons, tipples, underground haulage by means of endless chains, etc., etc.

Respecting coal-cutting machines, several forms have been invented, of which the "Legg" is probably the best in use to day. These machines are operated by compressed air, which is conveyed into the mine through large wrought-iron pipes about 5 inches in diameter, and stored in reservoirs situated in different parts of the workings. From these reservoirs, permanent

An Extraordinary Story.—The *Colliery Guardian* is our authority for the following extraordinary story: "A most singular experience has just befallen a Rhondda collier, named David Davies, of Treherbert. He was one of the many sufferers by the memorable explosion at Penygraig Colliery in 1880, for four years after which he was confined to his bed. He then gradually got about, but always remained absolutely deaf and dumb from the shock. The doctor who attended him advised him to try a shock somewhat similar to that which had caused his infirmity. A little while ago he placed himself as near, as safety would allow, to where six shots were to be fired in the Bute Pit, Treherbert, and, strange to say, at the sixth shot his hearing returned to him. Still he was dumb, but on Sunday, the 3rd inst., the Rev. E. Rowlands, missionary to the deaf mutes, said something to Davies which put him in a passion, and he involuntarily, or instinctively, made an attempt to express his anger. To his amazement, the power of speech came back, and he now talks freely."

pipes carry the air forward, from which smaller and temporary ones, supplying the machines, lead to the various portions of the mine. The object of storing the air in reservoirs is manifold; the supply from them being more uniform than if direct from the compressor, as the deep pulsations of the piston would be felt by the machines. It is supposed that the exhaust from coal-cutting machines adds to the ventilation; however, in mines of any magnitude, the assistance is hardly appreciable. Coal cutting machines are undoubtedly of great value to coal operators, as the work they perform, viz.:—the under-cutting of the coal, is that which would otherwise require skilled labour, so that, wherever in use, the management is not altogether at the mercy of labour organizations. Apart from this, the machines—especially in mines where long-wall work may be carried on—materially reduce the cost of production, but if the roof of the mine is poor necessitating the driving of narrow rooms, then it is questionable if mining by picks is not as cheap, owing to the time lost in moving the machine from room to room.

In conclusion, it is hardly necessary to state that coal-mining is becoming quite an important factor in the development of trade in the North-West, mines already being in operation at different points along the Bow River, from Calgary westward, also at Edmonton, Medicine Hat, Lethbridge, and on the middle fork of Old Man's River. Of course, some of these have not yet been developed to any extent, still the Lethbridge colliery may compare favorably with any in the Dominion of Canada, possessing as it does, the latest improvement in all kinds of machinery requisite for the proper working of a mine. It will, therefore, shortly be necessary for our legislators to enact laws governing the mining of coals in the Territories so as to ensure safety against inexperienced and reckless miners.

Rich Galena Mine in B. C.—The Blue Bell mine, belonging to Dr. Hednryx upon the east side of Kootenay Lake, B. C., exhibits at a depth of one hundred feet from the surface, an unbroken body of galena, over 36 feet in width. This far exceeds the thickest vein in the celebrated Cour D'Alene mines.

How to Get the Best Results from Coal.—The best engineer in Christendom cannot produce the best results with his plant when he has to depend upon an unskilled fireman, or upon himself, acting as fireman. It is a common notion that anybody can shove coal into a furnace, and that this constitutes all that a fireman needs to do. A great many mill agents, treasurers, to say nothing of boards of directors, cherish this idea, without realizing how serious it is. We assert that no man ought to be placed in charge of a coal-pile who cannot tell approximately how much can be deduced from it; it represents a certain number of foot pounds work; and has, therefore, a definite evaporative value. To speak plain, the coal-pile means just so many dollars' worth of work. The duty of expending this money, this raw material, should be intrusted to a well-experienced and well-paid fireman. Every engineer has his own specific share of work, and only false economy demands that he should move out of it. Engineers are neither omniscient nor omnipresent, but if they know their business, and are not afraid to tell the truth, they will not hesitate to recognize and condemn the wastefulness of the policy of hiring either a cheap fireman or no fireman at all.—*Practical Electricity.*

A Visit to a Charcoal Iron Furnace.

(WRITTEN FOR THE REVIEW BY SAM'L D. MILLS,
SUPT. MARTEL FURNACE CO., ST. IGNACE,
MICH.)

The ore thus reduced is in the condition of a metallic sponge, saturated with carbon and mixed with earthy impurities. It passes down till it reaches the zone of fusion, as it is termed, where the heat is so great that both the iron and these impurities are melted and drop down into the "crucible" below the "tuyeres." Here the slag or cinder formed by the fusion of the earthy matter, being lighter than the iron, floats on top, and is tapped off through the cinder notch, which is so placed as to enable it to be drawn off without letting the iron run too. As for the iron you will see presently what is done with it.

We now hurried round to the end of the "Casting-house," and had just time to notice how the sand is moulded up to form the "pigs." A sort of ditch leads straight from the front of the furnace down the middle of the house, having on one side several branches communicating with the "pig" moulds. These are arranged in beds containing about 25 in a bed. The branches are called "sows;" the main line the "runner." Across the "runner" are set wide iron staples, and resting against these and stuck down into the "runner" are the "gates"—cast-iron blades with long handles, in shape very much like the ace of spades—coated with clay, and large enough to dam up the runner. Up near the furnace is a large "gate," slightly different in shape, and with a long bent handle resting on a hooked iron staff fastened at the side of the "runner." This is called the "skimmer." While we were examining this portion of the furnace the whistle blew, and the keeper in charge started to work. He took a pointed bar and in a couple of minutes cut a hole into the iron notch, and the molten iron came leaping out. It was down the "runner" until it struck the first "gate," which forced its course into the first bed; and when this was partly full the "gate" was pulled out a little in order to let some of the iron down to the second bed, into which it was forced by the second "gate." By the time this was partly filled the first bed had been completely filled, and the "gate" was then "stuck" across the "sow" in order to prevent any more iron getting in. This operation was repeated until nearly eleven beds were full, making, we were informed, about twenty tons of iron. Just as they were filling the 6th bed one of the men called out "cinder?" and dropped the "skimmer" across the "runner." We saw a large stream of molten "cinder" flow over the side of the runner into a shallow channel, which led out into the yard close by the Casting-house. Three shrill blasts from the whistle sent the engine full speed; flames leaped from the iron notch, in turn succeeded by a brilliant shower of sparks which drove everyone out of the building. In a few minutes the men who had gone outside to get cool came in. Some pulled out the gates and staples; another threw sand on the red hot iron; two others, with wooden clogs strapped to their feet, walked over the red hot iron, and with long bars pried the "pigs" loose from the "sows," at the same time breaking the "sows" into pieces about 30 inches long. A workman who had been washing the hot "gates" with clay water came to the assistance of the others, and

in less than ten minutes the whole cast was broken up. We are told that in a couple of hours the "grader" and his men would come and break each "pig" in two, grade it all according to the grain, or chill, if it be a chilling iron, mark each piece, and pile it all according to the various grades in different parts of the yard.

We then asked the following questions: Why was it necessary to crush the ore if the absorption of the carbon broke it up? This was done because the process of carbonization, being gradual, the larger lumps are reduced and carbonized last, and if too large would pass down into the zone of fusion unreduced in part, this would cause loss, owing to the unreduced oxide combining with the silica and running off in the cinder as a silica of iron, causing irregular working in the furnace, making hard iron, and injuring the product in many ways.

Why was it necessary to level the ore in the buggies and have it placed so evenly around the bell of the furnace? Because as the ore is distributed in the "hopper" so will it descend through the body of the furnaces. If too much ore was charged on one side of the "hopper," that side of the furnace would work colder than the other; the gases would pass up chiefly on the other side, through the lighter "burden," raw stock, or unreduced ore, would ultimately pass down to the tuyeres on the colder side; a tuyere might get closed up; and things would go from bad to worse unless the evil was attended to in time.

What is "chilling iron"? "Chilling iron is an iron in which a sort of crystallization can be produced by the sudden cooling of the molten metal. This has the effect of rendering it extremely hard and capable of standing a great amount of wear, or friction, a quality of great value in many ways, but particularly in the manufacture of car wheels. To utilize this property, the wheel is cast in a mould, the circumference of which is formed by an iron ring, some two inches thick, and of the full width, and same shape as the intended wheel, by contact with this the metal is chilled. By using a proper mixture of iron, the wheel when cast has an extremely hard surface on the tread, this hardness extending into the wheel about $\frac{3}{4}$ ", while the rest of the wheel remains soft and to some extent tenacious. Although it is customary to think cast iron brittle, it possesses considerable tenacity in comparison with chilled iron, which will sometimes break like glass. If the car wheel was chilled right through it would possess great hardness, but no strength, and it would be impossible, owing to its hardness, to bore out the hub of the wheel so as to fit it on the axle." A specimen of a chill was brought, and we were shown the peculiarity of its formation. It was what is called a good "needle chill," of a silvery white colour, and had a striated appearance as if composed of flattened needle points laid parallel, with the points extending, some a little further than others, into the grey, rather close-grained iron composing the rest of the piece (pig); the chill was very even all across the side of the pig, and was about $\frac{1}{2}$ " deep. "Here," said the manager, picking up a piece of pig, "is a specimen of iron chilled all through," then dashing it down upon another piece he broke it into three pieces and remarked: "This is what a car wheel would be like if chilled through. This iron was made at a time when we had some trouble with the furnace, in consequence of one of our water blocks cracking and letting a lot of water in. It chilled the furnace so that we got on to hard iron, and it was several days before we got work into good shape again."

An Ingenious Signalling Arrangement.

Our attention has lately been drawn to a most efficient arrangement for signalling by electric signal apparatus from cages in motion in colliery shafts, hoists, &c., which have been devised and carried out by Mr. William Armstrong, Jun., mining engineer, Wingate Grange colliery, Durham. The object is effected by inserting an insulated copper wire in the strand of the winding rope, and by connecting it at the cage end to a push in the cage by simple arrangements such as are ordinarily used in making such connections. At the drum end of the rope the insulated wire is brought out and connected to a brass ring working upon the drum-shaft, and upon which a strip of cotton rubs so as to maintain an electric connection with the signal bell and battery placed in front of the engine man working the winding engine. Those in the cage by touching the push can instantly communicate with the engine man at any part of the lift, and signal to him to stop or raise or lower the cage. At the Newbattle Collieries, Dalkeith, where the signalling apparatus is now working, it has been applied in the pumping shaft, 300 yards deep and is specially used by the pumpmen for working at the pumps in different parts of the shaft. By means of the signal, standing in, or upon the top of the cage, the men can instantly signal their requirements.

Connections are also put upon the frame of each deck of the cage, so that coal work signals can be made by means of the rope at a great saving of time.

The application appears to be of special value in case of repairs in the shafts, affording as it does absolute safety to the occupants of the cage in making the signals, and it would also be of inestimable value in cases of accident arising from explosion or break up in the winding shaft, where the state of the shaft or of the atmosphere is unknown, and where in such cases many lives have been lost through the occupants of the cage having no means of signalling to the engine man. A case such as this was the well-known and recent case at the De Beers mine in South Africa, where the cage and its occupants including Mr. Lindsay, the manager, was lowered into a deadly atmosphere without means of preventing the descent after the cage left the surface.

The whole arrangement appears to be most simple and effective, and must be a considerable economy, especially in making repairs where time is usually very important. The signal is working at several important collieries in England and bids fair to come into very general use.

A Grant from Quebec.—Mr. L. T. Rochon, M. P. P., states that it is almost certain that the Local Legislature will give \$1,000 to the fund for the visit of the American Institute of Mining Engineers.

The Production of Canadian Asbestos.

The following is the estimated production of asbestos in our Canadian mines since 1879:

Years.	Tons of 2,000 lbs.	Value in Dollars.
1879.....	300.....	19,500
1880.....	380.....	24,700
1881.....	540.....	35,100
1882.....	810.....	52,650
1883.....	955.....	68,750
1884.....	1,141.....	75,097
1885.....	2,440 $\frac{1}{4}$	142,441
1886.....	3,458 $\frac{1}{4}$	206,251
1887.....	4,619.....	226,976
	14,643 $\frac{1}{2}$	851,465

The figures of the output for last year (1888) are not all to hand yet, but the production will be fully equal to 4,500 tons, if not above it.

The Koepe System of Winding from Shafts.*

The Koepe system of winding from shafts is the invention of Mr. Frederick Koepe, Manager of the Hanover coal mine, Westphalia, one of the collieries worked by Krupp, the well-known German ironmaster. The first trial of the system was made at the Hanover shaft, and proved so successful that several engines belonging to the same owner were reconstructed on the new plan. From an examination by inspectors it was demonstrated to the satisfaction of the German government that the system was not only in every respect more economical than the ordinary method of hoisting, but had also elements of a greater safety to recommend its universal adoption. The plan has since been adopted at several mines in the same district and others in France, and still later at the Bestwood colliery, near Nottingham, England. The principal and simplest form of the Koepe system can be applied to existing hoisting machines at little cost, by attaching and suspending an old hoisting-rope from the under side of the cage at the top of the shaft and connecting the opposite end to the under side of the cage at the bottom of the shaft. This balance-rope may hang loosely in the shaft, or it may pass around a tightning-sheave at the bottom. In this way all the parts of the hoisting-apparatus are perfectly balanced throughout the lift, which is not the case by any other system of adjustment. There are several modifications of the system; but the principle is the same in all cases.

The advantages claimed for the Koepe system are as follows:

1. Balancing the hoisting-ropes, thus reducing the size of engine, consumption of fuel and cost of plant for a given duty
2. The same engines will raise a given load from any depth in the shaft.
3. One rope only is necessary instead of two.
4. Safety from overwinding.
5. Less wear and tear of plant.

The benefit will be more readily appreciated by taking examples of engines fitted with parallel drum, in comparison with the Koepe engines with winding-pulley and counterbalancing tail-rope. This, according to the greater or less depth of shaft, varies from 35 to 64 per cent. of the power required to lift the unbalanced load. Wherever parallel drums are used it is possible to increase the duty of the engine by the addition of a balance-rope.

Quite recently a plan has been adopted at a Pennsylvania colliery, said to be a new invention, and called the "Poore" system, which is believed to be nothing more than a modification of Mr. Frederick Koepe's invention.

It is not necessary to enter into further particulars. The system will be found fully described and illustrated in the *Transactions of the Chesterfield and Derbyshire Institute of Mining, Civil and Mechanical Engineers*, vols. xi. and xii., 1882-83, from which I have gathered my information.

*Trans. Am. Inst. of Mining Engineers.

KINGSTON DRY DOCK.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Dry Dock," will be received at this office until Thursday, the 24th day of March next inclusively, for the construction of a Dry Dock at Kingston, Ontario, in accordance with plans and specification to be seen on and after Wednesday, the 6th day of March next, at the Engineer's Office, 30 Union Street, Kingston, and at the Department of Public Works, Ottawa.

Intending contractors are requested to bear in mind that tenders will not be considered unless made on the printed forms supplied and accompanied by a letter stating that the person or persons tendering have carefully examined the locality, have satisfied themselves as to the nature of the materials to be excavated, and the foundations for the cofferdam and its probable cost. Tenders must be signed with the actual signatures of the tenderers.

An accepted bank cheque, not limited as to time of payment, for the sum of \$20,000, payable to the order of the Minister of Public Works, must accompany each tender. This cheque will be forfeited if the party decline to enter into a contract when called on to do so, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works
Ottawa, 15th February, 1889.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his mining receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

A. M. BURGESS,

Deputy Minister of the Interior.

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed, we can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 23, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

DEPARTMENT

OF

Inland Revenue.

An Act Respecting Agricultural Fertilizers.

before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits

a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have
used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force
thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet
from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler,
and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly, F. L. BARTLETT."

Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or stake out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

A. S. HARDY,

Commissioner

Department of Crown Lands, Toronto.

The Ontario Mining Company (Limited) are applying for a charter of incorporation for the purpose of acquiring and working mineral lands in the Province of Manitoba. The capital stock is to be \$20,000, in 2,000 shares of \$10 each. The applicants are:—Hon. Gilbert McMicken, Winnipeg; Hamilton Grant McMicken, Winnipeg; George Heenan, Rat Portage; John Albert Kirk, Stratford, Ont.; A. J. Parsons, Rat Portage; George Clayton Frisbie, Rat Portage; Mortimer Marcus Wheeler, St. Paul, Minn.; A. T. R. Blackwood, Winnipeg; J. H. Challoner, Rat Portage; J. G. Bennett, Winnipeg; A. C. McMicken, Winnipeg; C. S. Hoare, Winnipeg; G. H. R. Wainwright, Winnipeg; William Blackwood, Winnipeg; Herbert James Belch, Winnipeg, and the Hon. Thos. Howard, Winnipeg; of whom Hon. Gilbert McMicken, H. G. McMicken, J. H. Challoner, George Heenan and Mortimer M. Wheeler are to be the first or provisional directors of the company.

Edison's New Method of Separating Iron Ore.—Many iron men and others continue to flock to a secluded section of Washington Township, where experiments are soon to be made with one of Edison's greatest and most recent inventions, known as the Edison concentrator, the object of which is to concentrate the real ore dug from a mine, and get rid by mechanical means of all dirt and earthy matter that interferes with smelting. This machine has been successfully tested in Mr. Edison's laboratory. It is claimed that it will reduce immensely the cost of smelting and bring into use ores that cannot now be profitably worked. New York capitalists have purchased eight acres of iron ore land, where the experiments will be made. Building and machinery are now being put up at a cost of \$35,000. The invention, it is believed, will work a revolution in the iron trade. The working of the ore concentrator is not to be a secret, as supposed. The rock containing the ore, after passing through the crusher and broken to the size of an egg, is dumped into a large hopper. From here it drops down an incline within a few inches of a powerful magnet. This will be so heavily charged as to draw the ore from its course into one channel, and the rock and other foreign elements contained in the ore are permitted to pass through another channel into the refuse pile.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

The Canadian Mining Review

CONDUCTED BY . . . B. T. A. BELL

OFFICES:

UNION CHAMBERS, 14 Metcalfe St.

OTTAWA.

Vol. VIII. APRIL, 1889. No. 4.

Our Libel Suit.

We were not a little amused, a few days ago, to read in the *Montreal Gazette* that a certain Charles Lionais, mine promoter and manager, proposed to enter suit against the REVIEW for the fabulous sum of *fifty thousand dollars*, being damages claimed for an alleged libellous paragraph which appeared in our last issue. There is certainly nothing small about Mr. Charles Lionais. The item in question was published in our Phosphate Notes, and was as follows:

Mr. C. Lionais, formerly superintendent of copper and asbestos mines in the Eastern townships, is reported to be making elaborate preparations for commencing work on some lots adjoining the Blackburn estate. Telephone communication to the station, electric light and a costly plant are said to be in course of erection. Perhaps it might be well to ascertain and prove the true value of the property before going to all this expense. Extravagance and illadvised management have in the past wrought enough harm to our Canadian mines, as a number of properties with which Mr. Lionais is not unacquainted, can testify.

Mr. Lionais, it is stated, takes exception to this simple, outspoken paragraph on the ground that owing to the extensive circulation of the REVIEW in Great Britain and the United States it will have the effect of deterring capitalists from investing their money in his property."

It will be observed that we have said nothing against the *value* of the property, other than to suggest that being comparatively undeveloped and entirely unproved it does not, in its present state, warrant anything like the elaborate and costly works which are reported to be in course of construction upon it. Dr. Selwyn, the able Director of the Geological Survey, made a thorough examination of the property in 1887, and a few weeks ago having occasion to be in the district again, became acquainted with what is now going on there. Writing under date of 18th Dr. Selwyn says: "I have no hesitation in saying that unless some extensive developments, of which I am not aware, have been made since I examined the property in 1887, I do not consider such expenditure as you refer to advisable. The money would, I consider, be more wisely expended in actual mining operations to develop the undoubtedly good indications which there are on the property."

We could cite many similar expressions of opinion by practical engineers and mining men did we consider it at all necessary to do so.

It is the duty of the mining press to bring about a truthful and honest representation of all mining ventures whether they be mines fully developed or mere "prospects" about to be, or partly opened up, in order that a fair bargain may be arranged between the vendor and the purchaser. Investors must be warned against the payment of excessive figures for undeveloped properties—no matter how good indications they may contain—until sufficient work has been done to prove them *mines*. Mr. Lionais is credited with being a miner of "large and varied experience." Has he forgotten the history of mining all the world over, and the many deplorable instances in Canada where extravagance, incompetence and visionary management have resulted in a lamentable loss of capital? Surely

he must be aware that perhaps no other line of enterprise has suffered so much from a total disregard of the fundamental principles of business.

At the instigation of Mr. C. B. Falardeau, a number of Mr. Lionais' friends have written evidently with the object of inducing us to withdraw the paragraph. We will do nothing of the sort; and if Mr. Lionais is really serious, and is not catering for a little cheap notoriety, we will meet him in Court, and substantiate any opinion we may have expressed in these columns.

Another Bubble Burst.

The collapse of the Mineral Phosphate Company and its promoters has lately been the chief topic of conversation among mining men and the phosphate trade generally. It is admitted by everyone that the price asked for the property was ridiculously high, and far in excess of its true value, while the many discrepancies between statements and facts apparent in the Prospectus have been much commented upon. *Appropos* of this concern, an English exchange has the following pertinent remarks:

"We observe that the person upon whose figures the directors solely rely for the estimate of dividend is a Mr. McAndrew. A foot note informs us that Mr. McAndrew has been good enough to accept the appointment of manager. Is this gentleman a storekeeper at Buckingham Village, near by the property? And, if so, what does he know about phosphate mining? Mr. McAndrew bases his calculations upon a selling price of 1s. 2½d. per unit, or £5 1s. 6d. per ton of 84 per cent. phosphate. Where does he get his figures, and how comes it that the directors have accepted them as correct? We invite them to say whether it is not the fact that this price has not been obtained for the last four or five years, and that the present price is only 1s. per unit, or £4 4s. per ton? If we are right, then over 25 per cent. must be deducted from the net profits as estimated in the prospectus."

This should be a lesson to those stupid persons who place an infinite reliance upon the gullibility of the English investor, and who overreach themselves in order to "get ahead" of their neighbors. While the failure of the concern does not come as a surprise, it is greatly to be deplored, inasmuch as it may seriously affect the disposal of many excellent properties now in the market.

Mining in Nova Scotia during 1888.

The Annual Report of the Commissioner of Public Works and Mines, Nova Scotia, lies on our table, and containing as it does a large amount of valuable statistics and information respecting mining matters in that province, its summary is laid before our readers in as concise a form as possible. There is an increase in the yield of six and a decrease in five of the minerals recorded in the tables for 1888. Of gold, 22,407 ounces are returned as against 21,211 in 1887, the wet summer having militated against a larger yield, as in a converse ratio the dry season operated detrimentally in the previous year. Numerous fresh discoveries are reported from all points on the auriferous belt, and some of them it is confidently believed will prove valuable. All the gold mining of Nova Scotia is conducted by means of crushing, and placer diggings are unknown. Despite some

failures, mining business may be said to have improved, and outside capitalists are looking for investments. Salmon River, Carribou, Whiteburn, Lake Catcha and Stormont are the districts reported to have in their respective order afforded the highest returns.

The coal trade at the mines is almost the same as in 1887, the sales reported in 1888 being 1,576,692 tons against 1,519,684 in the previous year, the increase being 57,008 tons. There was an increase in home consumption, an increase of 28,000 tons in sales to Quebec, an increase of 28,000 tons in New Brunswick, and a large falling off in sales to the United States, amounting to 43,694 tons. The cause of the latter is not stated. During the past season the regular manufacture of coke has been commenced at the Gowrie mines, Cape Breton, on a small scale, and several hundreds of tons were shipped. This coke is largely used in copper concentration and smelting operations in Newfoundland. The inspector of mines seems to have exercised his duties very carefully, and the accidents reported have not been as fatal as in former years. Reports of coal discoveries are mentioned in Colchester and Cumberland counties, and should the tests now being made prove satisfactory the localities will be found to be advantageously situated, as the Intercolonial Railway runs through the district. Mention is made of the necessity of a constant supervision over pit ropes, and testing those made of wire. Attention is called to a new rope known as the "Lang locked wire rope," in which the wires are so moulded as when put together to make practically a homogeneous flexible rope, which is reported to have stood in use twice as long as the ordinary rope under similar conditions of wear and tear.

Of iron, 41,619 tons were mined by the Londonderry Co. and smelting operations were satisfactorily conducted, the yield showing a slight decrease compared with the previous year. Copper mining in Nova Scotia is in its infancy, but much interest was shown in the search for workable deposits of this ore, and the Report states that the question of their existence is satisfactorily answered in the affirmative. The lead mine at Smithfield is still awaiting capital to work it. The export of gypsum is on the increase; manganese shows a great falling off, owing to the great depreciation of its value in the early part of the year. The increase that has since occurred is expected to revive the workings of this mineral. Antimony is still only produced at Rawdon. In addition to the above mentioned minerals 1,100 tons of barytes, 1,760 tons of grindstones, 169 tons of mouldings and, and a large quantity of limestone are recorded as helping to swell the value of the products of the mine in Nova Scotia in 1888, and the Report closes with a table which gives the value of the exports from Halifax. This, however, representing only one fact, is very apt to be misleading, as a casual reader might look upon it as representing the *total* exports of the

province. It seems to us it would have been better either to give the total export of all the ports of the province, or else none at all. We merely allude to this to guard readers of the Report against an error they might unwittingly fall into.

Mines and Mining on Lake Superior.

The extent of area dealt with in the report by Mr. E. D. Ingall, M.E.A.R.S.M., being Part H of the Annual Report of the Geological Survey of Canada, just issued to the public, covers a tract of country from 81 to 91 degrees of longitude west along the shores of Lakes Huron and Superior, including the silver bearing area around Port Arthur, and about 3 degrees of latitude in the same space. Its geological features are treated, and its mineral resources are enumerated, viz: iron, magnetic and hematite; copper; silver; gold, both free and in its baser form; zinc blende, and a variety of other useful but less generally important minerals such as ornamental stones, mineral pigments, &c. A succinct history of the region follows, dating back forty years, when Sir William Logan called attention to it, and subsequently explored it, down to the discovery of the rich silver ores of Rabbit Mountain in 1882, and the still more recent operations of the present time. The opening of the C. P. R. and its facilities for communication with this district are compared with the former means of communication by water routes only, and the isolation which originally marked that district rendered all efforts to develop it difficult in the extreme. Under the existing mining laws large tracts become tied up for speculative purposes, and a change in the laws is needed "to ensure actual working and to foster discovery by rendering it as easy as possible for the explorer to get the *full* benefit of his toilsome and dangerous efforts." The area of the silver bearing rocks is estimated by Mr. Ingall at approximately 1200 square miles, and a map accompanies this estimate, the special groups being enumerated as the Coast, the Port Arthur, the Rabbit Mountain, the Silver Mountain, and the White Fish Lake group.

Under each of the above headings the different mines are described, commencing with that of Silver Islet, in which, though operations are now suspended, the yield of silver was immense, and the venture proved the most extensive and successful of all yet undertaken in the district alluded to. The total value of silver produced from the commencement to the close of operations at Silver Islet is quoted at \$3,250,000. Numerous other islands where silver mines exist are also fully described, together with the works thereon. The coast section and Pie Island are reported upon, and the Port Arthur group next occupies attention. Under this

heading, we find Thunder Bay and Shuniah mines, together with a number of smaller mines or workings, and under Rabbit Mountain heading the rich Rabbit Mountain and the Beaver mines come in for a full description. The latter is especially rich, for Mr. Ingall quotes the statement of an Algoma paper, where it is stated "the total value of the products of the Beaver mine for the past two and a half months is \$93,000. This may be relied on as authentic." Mr. Ingall goes on to say there is every reason to believe this to be correct, as the Port Arthur Customs entries show \$190,000 worth of ore exported during 1887, the greater part of which certainly came from this mine. In the Silver Mountain group attention is called to the native silver occurring at Silver Mountain mine in leaves, sheets and nuggets weighing often several ounces, but litigation, which too often seems to be the fate of mining companies when rich veins are struck, has put a stop to work for the present. The Whitefish Lake group exhibit numerous veins, but very little mining has been done there. Mr. Ingall in summing up the whole area says that where it has been prospected the work has not been thoroughly carried on, and the question of the capabilities of the veins as ore producers is still unsettled, a remark which also applies to many of the mines opened years ago and closed altogether. There is, however, evidence of the widespread occurrence of rich silver ores throughout the whole formation of the district, and the existence of very numerous veins, on many of which, if properly handled, successful mines may be opened up. Experience has taught that more extended underground developments are required to prove their value, and unless this is acted upon with a sufficient of the capital at the start the failures of the past will be repeated in the future. Irregularities in width of veins in some cases dishearten operators, who are led thereby to believe that their vein had "pinched out," but pluck and energy in following it will generally carry the miner through the disturbed parts to where the vein will again be rich and solid. This has been proved by actual experience. The formation of the enclosing rock and physical characteristics of the surrounding formation tend to produce here and there fractures, and the dips of veins have in most cases not been sufficiently worked out to form a basis for classification.

From Port Arthur as a centre, the shore portions of all the district above described can be easily reached by small craft or steam tugs, while the C. P. R., the Dawson Road, and boat and canoe routes over the lakes and rivers, give means of communication with the inland portions. This district must figure largely in the production of silver in the years to come, and to those interested in the locality we cannot remember any Report which will throw more or better light on it than this by Mr. Ingall. He has done his work well and faithfully.

Annual Report of the Minister of Mines for British Columbia, 1888.

The above volume, just received, differs somewhat from ordinary Government blue books, being a series of reports from the various Gold Commissioners and Government agents of the province, each of which contains its own details and no regular synopsis or summary, if we except the tables showing the yield of gold, as given in the Minister's report itself. From the latter tables we gather the fact that there was decrease in the yield of gold during the past year to the value of \$76,978. This is shown to be attributable to various causes, in some cases as at Cassiar, the mines being gradually worked out, without new discoveries, and in other cases from lack of business principles in conducting operations. In this connection Mr. Sutton, government assayer at Victoria, very wisely remarks that very many of the misfortunes attending mining ventures in the province are brought about from a too eager desire to turn the yield into bullion, mills and machinery being provided *before* the existence of a sufficient quantity of paying ore has been definitely ascertained. This, he says, ought to be patent to anyone who has followed the history of mining in British Columbia. "Why run the danger of having a mill on your hands with no grist to grind?" Mr. Sutton's report contains a valuable list of the economic minerals found in the province, giving their localities, and he expresses the hope that this "will answer as a commencement towards a systematic arrangement of definite information" on this subject. Such a synopsis has long been wanted, and we hope to see Mr. Sutton continue it yearly with annual additional remarks. Speaking of the mineral characteristics of the province, he goes on to say: "It is somewhat premature to lay down any rules or observations," owing to want of development, and he complains that the samples sent from different points for assay are invariably too small to give satisfactory returns: "Pet samples" are misleading, and calculated to destroy confidence; samples for assay should not be less than one pound in weight.

Slate of an excellent quality has been discovered near Golden, and close to the C. P. R. track. Slabs of any desired size can be taken out, for billiard tables, mantles, flagging, &c., and it is pronounced to be adapted for roofing purposes. This discovery may be of great value. Platinum yielded in 1888 1,500 ounces. The only locality in British Columbia where it is obtained in sufficient quantities to render it worthy of mention is at Nicola.

The inference to be drawn from the various reports from each mining district may be summed up as follows:—Cariboo, successful; Keithly, falling off; Cassiar, yield decreasing; Kootenay, great promise, but requiring development; West Kootenay, far ahead for silver, of all other districts, both in quantity and quality; Jilloet, a shrinkage in yield;

ale, great promise, and mining companies showing unusual amount of energy.

There has been a marked increase in the output of coal last year, it being 75,940 tons over that of 1887. The report states that the increased demand and the satisfactory price which it has realized in the market have greatly enhanced the prosperity of the coal industry of Nanaimo, Wellington and Comox, where upwards of 10,000 men are constantly working in and about the mines, who with their families and homes of their own are to all appearance contented, prosperous and permanent settlers. The exports of coal were chiefly to ports in California, and smaller cargoes went to other Pacific ports, whilst British and American ships-of-war, ocean mail steamers and other vessels have also drawn supplies from the province. Extensive works in connection with the coal mines have been carried on in the Comox district last year, and a railway has been constructed from the mines to a shipping terminus, at Union Bay, where commodious wharves have been built. This has involved the expenditure of a large amount of capital, for which good returns this year are anticipated. British Columbia affords every evidence of being the coaling station of the Pacific in the future. Detailed returns of the various collieries are given at the end of the report. The various Commissioners and Government agents afford very valuable information respecting the districts they supervise, and it is at once apparent that their examinations are not by any means superficial or unreliable.

Electricity as a Mining Power.

At a recent inaugural address in England, before the north of England Institute of Mining and Mechanical Engineers, delivered by Mr. J. Marley, upon "Improvements in Mining," it was stated that the tendency of mechanical invention is decidedly to "elaborate other means of steam raising at the expense of coal," and economy in the consumption of the latter was strongly urged. The transmission of power is a subject now attracting great attention both on this continent and in the old world, and compressed air, hydraulics and electricity respectively have their claims advanced by their own advocates. Electricity seems to us the most likely means for adoption in the near future. In England already several mining companies have undertaken the application of electricity to the operation of mining machinery, and in the United States this power is largely used. The best means of convincing the incredulous is to cite some instances for them, and we can only choose from those to be met with in England and America. In the St. John Colliery at Normantown, the electrical transmission of power has been installed to work a pumping engine at the bottom of a shaft. A volume of water of 23,000 litres (100 litres = 22 gallons) per hour furnished by a subterranean sheet of water has to be raised to a height of about 270 metres (1 metre = 3.2808

feet). The pumps have been calculated for 32,000 litres per hour, and they have delivered regularly during the month of February last, 562,500 litres per day. The generating dynamo furnishes a current of 600 volts to the boundary, with an average of 66 amperes. The electromotive force at the boundary of the receiver is 575 volts. The result in water raised is about 33-horse power, and it follows therefore that the electrical transmission utilizes at least 50 per cent. of the power furnished by the steam motor. Compared with compressed air, electricity permits the realization of an economy of 25 per cent. on the expenses of first establishment, without counting the facilities of placing, inspection and maintenance presented by electrical motors. In the United States the installation is being prepared in Arizona for transmitting a force of 150 horse power to a distance of eight miles, between a waterfall and a mine. In Comstock the electrical transmission of power is to be applied to the workshops of New Nevada, where there are twenty crushing mills. In the Consolidated Virginia and California works there is a question of replacing by electricity the transmissions by metallic cables, which have caused very great disappointment. At Silver City some Sprague dynamos have been set up for a works of fifty crushing mills at a distance of four miles from a waterfall. These facts of recent date prove that the electrical transmission of force is making progress, and that opportunities are not wanting for it to be used. But its application in other ways, such as in driving vessels and the working of cranes, is indirect assistance to its extended employment in the mining industry. Pumping, winding, lighting, and accessory mechanisms are capable of good service from this source, and the miner who restricts himself to the employment of antiquated plant will find himself behind in the current of daily advance if he adheres to his old methods.

An Example of Bravery.—One of the most unexampled cases of bravery occurred at Hammond Colliery, near Girardville, recently. As an illustration of the devotion of one workman to another it was unexcelled. Thomas Hobin and Patrick Dougherty, two young men, were working together. A large piece of coal blocked the chute leading from one of the breasts to the gangway. This chute had a pitch of 75°, which is very near perpendicular. The block of coal was 18 feet from the gangway, and a plank was placed in position. Up this Hobin crawled, and after drilling a hole in the coal inserted a piece of dualin to which was attached a fuse. He lit the fuse and turned to descend. As he did so a rock fell from overhead and crushed the life out of him. Dougherty heard his death cry, but thought that he was merely caught, not killed. He could see the fuse burning, and knew that if the blast went off his friend would be blown to pieces by the flying fragments. In an instant he was up the steep plank, and snatched the burning fuse just in the nick of time. He was successful, but the cruel rock had crushed the life out of poor Hobin. There is a movement on foot to present him with some token. Mine Inspector Stein paid him a high compliment at the coroner's inquest.—*Colliery Engineer.*

In General.

Messrs. Couper, McCarnie & Co., the well known London firm of brokers and shippers, have dissolved partnership. The firm will hereafter be known as Couper, Miller & Co. The new partner is Mr. C. C. Hoyer Miller, one of the directors of the Canadian Phosphate Company.

B. L. Nowell, against whom six bills of indictment were laid for obtaining money under alleged false pretences and which were thrown out by the grand jury, has taken out an action for \$20,000 damages against James D. Macfarlane, who had preferred the charges.

The Canadian Superphosphate Company has been incorporated. The Hon. M. C. Cochrane, Wm. Abbott and Charles Colby, M.P., are provisional directors of the concern. The capital stock is placed at \$1,000,000.

Sales.

Sales of Canadian phosphates have recently been made in London at 9d. for 70 cent., 10d. for 75 per cent., while there have been enquiries for 60 and 65 per cent., which have not hitherto been asked for in England.

Du Lievre.

Navigation was resumed on the river on the 12th instant. Capt. Bothwell reports this to be the earliest opening within his recollection. The C. P. R. branch from Buckingham reopened upon the same day.

The transportation of ore will commence this week. The various stocks awaiting shipment and the preparations for handling them promise a busy season, but the difficulty of the passage at the Little Rapids, increased by the unfinished construction of the long desired locks, is realised by the shippers. The first scow of up freight for the mines has paid the penalty of the experimental trip by capsizing her contents, and scoring a heavy loss to the High Rock mines.

Acting upon the suggestion thrown out in our last issue, a deputation of mine owners, mine superintendents and managers, and others interested in the phosphate industry, waited upon Sir Hector Langevin at the House of Commons on the 24th instant. The party comprised Alonzo Wright, M.P., W. J. Poupore, M.P.P., W. W. Pickford, High Rock mines, J. Lainson-Wills, Canadian Phosphate Co., W. A. Allan, Little Rapids mines, A. Cameron and Capt. Bothwell, Buckingham, and B. T. A. Bell, editor of the REVIEW. Alonzo Wright, M. P., introduced the deputation, and Messrs. Wills, Poupore, Allan and Pickford urged upon the Minister the absolute necessity of the provision of a steam winch on float, or some other mechanical appliance, for the purpose of hauling craft up the channel at the Little Rapids, and it was pointed out that unless this was done without delay the various mines would be put to a very great inconvenience, and the transportation of phosphates and supplies would be very seriously interfered with. Sir Hector promised that the matter would be attended to, and referred the party to Mr. H. F. Perley, C.E., Chief Engineer of the

Department of Public Works, to whom he very graciously gave a letter of introduction explaining the urgency of the case. Mr. Perley, who was next seen, said he fully realized the importance of the matter, and led the party to understand that it would have his immediate and prompt attention. There is, therefore, every prospect that this obstruction to our local industry will be obviated at an early date.

Just as we go to press we learn that the Minister of Public Works has acceded to the request of the miners, and has given instructions to have the steam winch and float provided at the Little Rapids. This prompt recognition of the wants of the industry will give entire satisfaction to all concerned.

Mr. E. D. Ingall, M.E., and Mr. James White, of the Geological Survey, will shortly resume their investigations and survey of the phosphate region. The elucidation of the nature and origin of these deposits as a guide where and how to seek them, and the preparation of a map of the area under study on such a scale as will permit the delineation of the details of the distribution and association of the different rocks, are the chief aim and objects of this important work. Of the 210 square miles to be comprised within the limits of this map, the lakes, rivers, roads, &c., over some 125 square miles have already been surveyed by Mr. White. It is hoped that the balance of the work will be completed this summer, and that the report and map will be ready for the public by this time next year.

The Dominion Phosphate Company have improved their means of haulage at their No. 2 pit by completing the inclined track from the bottom to grass. The current output has been maintained during the development work by attacking the No. 5 pit. Prof. Donald has just sampled the stocks of ore for the buyers, Messrs. Lomer & Rohr, and shipments will commence forthwith. The steamer *Kate* has been thoroughly overhauled for this work, and is now afloat.

The output from the No. 11 pit at High Rock has shown a falling off during this month, but an improvement in their No. 5 is very encouraging. A new pier at the river landing is near completion, and preparations are made for discharging the scows by means of a steam hoister at Buckingham Village.

We have noticed a nice pile of ore from the Central Lake mines ready for shipping into scows at Chalifour's Landing. The exploratory work at these mines is evidently giving every satisfaction. Mr. Powers has uncovered some very fine shows which will afford good summer work.

The reports from the Canadian Phosphate Company's mines are satisfactory, the output being steady, and although the "Big Pit" at Star Hill shows a falling off, the last opened works are giving good results. The newly constructed scows have been successfully launched, and the wire tramway to river has resumed its activity.

The first down shipment of ore to the village has been made by the Ottawa Phosphate Mining Company from the Emerald mine.

Perth District.

Cap^t. R. C. Adams, managing director of the Anglo-Canadian Phosphate Company, has been called to England on company's business. The pits at Bobb's and Otty Lake are looking well, and are yielding a fair output.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

NOTICE.

At the Annual Meeting of the Gold Miners' Association of Nova Scotia, held at Halifax, on 6th March, a resolution was passed adopting the "Canadian Mining Review" as the official organ of this Association. Our readers may therefore rely upon the accuracy of all information published in these columns bearing on the gold mining industry of the Province.

Nova Scotia.

Darr's Hill District.

It is understood that a suit has been instituted by Chas. F. Mott, of Halifax, to set aside the sale of the Dufferin mine, made at public auction on the 14th March. The yield of the mine for March was 156 ounces.

Killag.

Last autumn Mr. Geo. W. Stuart and associates took out some quartz from a 4 inch lode on the edge of the big swamp. Five tons of this were recently crushed, and yielded 10 oz. 11 dwt. 10 grs., or over \$40 per ton. A steam plant of 15 h.p. is being placed upon the swamp shaft, and will be used to work pumping and hoisting gear. As soon as this gear is completed sinking will begin, and the work prosecuted all summer.

Stormont District.

The Palgrave Mining Company obtained 170 ounces of gold last month from about 270 tons of quartz. The lode keeps its size, and is maintaining its average yield. The prospects for the future look well.

South Uniacke.

The Witherow-Hartlin property owners are enlarging their mill by the addition of five new stamps, supplied by I. H. Matheson & Co., of New Glasgow. The original plant was supplied by the Windsor Foundry Company.

Renfrew District.

The new mill of the Empress Company dropped its stamps for the first time on the 3rd instant. Latest advices say the mill is running very smoothly, and is crushing at the rate of three tons per head per diem, which is the best performance yet on record in this province.

Oldham District.

The Oldham Gold Company is doing nothing but pumping water. The Standard Gold Company are pushing work, and their property never looked better. The yield for March was about \$5,900. The east shaft and main shaft are both sinking, and the 350-foot level is in good ore.

Mahone Bay.

Mr. John A. Anderson and associates have a force of men prospecting on Blockhouse Hill. Good drift has been found, but no lodes have yet been cut.

Miscellaneous.

The first concern to manufacture pig iron in Canada will probably be the New York and Nova Scotia Iron and Railway Company, which proposes to erect two furnaces at New Glasgow, N.S., one for Bessemer and one for foundry pig iron, one of which will have a capacity of 25,000 tons per annum, employing several hundred men in mining the required 50,000 tons of ore, 50,000 tons of coal and 25,000 tons of limestone. Tunnelling will be commenced this month to analyze and ascertain the extent of the deposit, but the outcrop gives good indications. A staff of ten engineers has been surveying railroad routes from the mines to New Glasgow and the Intercolonial Railway since December, and the citizens have offered 100 acres within the town limits to any company working the mines. Bessemer pig iron is made from non-phosphoric ore, of which there are several veins along the East River.

At the last meeting of the Gold Mining Association, held on the 9th instant, Mr. George J. Partington was elected secretary-treasurer, in place of Mr. Townsend.

Prospecting work will be commenced in the American Gold Company's area next month.

The first decision in the co-partnership suit of Putnam v. Hardman & Taylor, which has been going on in the Supreme Court for two years, was given on the 20th April, and was substantially a verdict for the plaintiff. The case will be appealed.

On the East River of Pictou, 342 tons were mined by the Messrs. Grant and shipped via Hopewell to the Londonderry furnaces. This is a limonite of good quality.

The fall in the price of manganese ore lessened the production of the mineral last year at Tenny Cape and Onslow; but as the value has risen it is expected that during this season business will be brisker at these points.

The returns of the shipment of antimony ore mined by Mr. Macnaughton at Rawdon are given as 308 tons of No. 1.

Official returns to the mines office show that 41,619 tons of ore were mined by the Londonderry Iron Co. last year, and that 164 men were employed about the mine above and below ground.

Mr. R. E. Chambers with a small force, took out 1,000 tons from his limonite deposit at Brookfield. The vein was cross-cut and proved to be 18 to 20 foot wide. The ore hitherto extracted, has been smelted at Londonderry. It is of excellent quality and very accessible, being within two and a half miles of the railway.

New Brunswick.

The Victoria Mining Company are applying for letters of incorporation. The capital is \$10,000, the offices in Andover, and the applicants as follows: John E. Stewart, contractor, Andover; F. P. Thompson, manufacturer, Fredericton; Daniel McQueen, contractor, Woodstock; J. W. Hoyt, claim agent, Blissville; Whitfield Giberson, lumberman, Aroostook; James Stewart, contractor, Andover; Chas. H. Lugin, barrister, Fredericton. The provisional directors are: John E. Stewart, F. P. Thompson, Daniel McQueen, J. W. Hoyt, and Whitfield Giberson.

Quebec.

The revenue derived by the province from the sale of mining lands for the year ended 30th June last was \$5,225.55. The fees on permits, etc., granted to parties interested in mining amounted to \$839.00, and the expenses to \$20.78. The Commissioner of Crown Lands states that it is evident that future results will be of much greater importance. A complete reconstruction of the present Mining Act is promised. This, everyone will admit, is urgently needed, and if the new laws are only modelled on lines similar to those of the sister provinces of Nova Scotia and British Columbia there can be little doubt that an impetus hitherto unknown will be given to the mining industry of the province, and the present depleted state of the Treasury will be amply replenished.

During the last four years the Villeneuve mica mines have supplied the trade with about 35,000 lbs. of mica, representing an annual output of 9,000. There has also been taken out a crystal weighing 281 lbs., which yielded about \$500 worth of merchantable mica. At present the pure white felspar is being successfully used in the manufacture of pottery.

Preparations for a brisk season are being made at the New Rockland slate quarries. Slate of excellent quality is being won from a bench at a depth of 200 feet. It is expected that the output this year will be much more satisfactory than that of 1888.

The output of asbestos last year from Mr. W. H. Jeffrey's mine at Danville was in the vicinity of 207 tons. A blast on the 23rd inst. yielded 1,133 lbs. The daily output at present is 500 lbs.

Mr. Selater, of Fenwick & Selater, informs us that the actual output from the Megantic asbestos mine was 125 tons, as follows: *First* 30 tons, *Seconds* 50 tons, *Thirds* 45 tons. An average number of ten men were employed.

We understand that the Ward Ross asbestos mine at Thetford is at present on the English market, and is likely very soon to change hands. The property, owing to the limited means of the present owners, has only been worked on a very moderate scale. The pit at present shows an exceedingly good quality of asbestos and gives indication that if properly worked with ample capital it would prove a fair investment for any one taking hold of it.

The gold industry of the Chaudiere district has been prosecuted more vigorously lately than in former years. The four companies at present working are the Horace Sewell Co. on the Des Plantes, McArthur, and Coupal at St. Francis, Capt. Richard's on the Cumberland, and the St. Onge Bros. on the Famine.

The Shaft at the Des Plantes works is down to a depth of 30 feet, is about 60 feet east of the stream and half a mile north of the bridge near the mouth. Dr. Ellis, in his recent report states that coarse gold in good paying quantities is taken from this spot. The head of the river at one time yielded a large quantity of coarse gold.

The most extensive workings in the district are now carried on at the Ruisseau Meul, a branch of the Millbrook near St. Francis village.

A tunnel has been driven into the hill to a distance of 600 feet, in an old channel which at 400 feet was 30 feet below the adjoining bed of the brook from which it was separated by slate reefs. The gravel of the old channel has yielded considerable coarse gold, nuggets from \$5 to \$15 value having been taken out during the past season. Drifting near the upper end of the tunnel is now being carried on, but much difficulty is experienced from quicksand. Neither here nor at the Des Plantes are there any appliances suitable for saving fine gold, and some changes in this respect will be necessary before satisfactory results will be obtained. From 12 to 14 men were employed during the past season.

The work done by Capt. Richards on the Cumberland has been very largely of an exploratory nature and no returns of gold taken out are to hand. Difficulty from quicksand is experienced here in sinking shafts.

The St. Onge Bros. have driven in the east bank about a mile above the road across the mouth of the Famine, for several hundred feet in what they claim to be an old channel of that stream, and gold has been taken out in small quantities.

From the prospectus of the White's Asbestos Company (Limited), recently formed in London, we glean the following particulars regarding the new concern:—The capital is £100,000, divided into 100,000 shares of £1 each. The directors are John A. Hamilton (Messrs. Alston, Hamilton & Co.), 21 Mincing Lane, London, chairman; Major Henry Creagh, 29 Gwendor Road, West Kensington, London; T. B. Forward (late of Forward Bros. & Co.), Hawkshead House, Hatfield, Herts; J. Pellat Rickman (Messrs. Apsley, Pellat & Co.), 17 St. Bride street, London; and Alfred H. White, Quebec. The property conveyed consists of lots 5 and 6, 1st range South Garthby, 67 acres; lot 16, 3rd range South Garthby, 100 acres; lot 7, 6th range Coleraine, 105 acres; and lot 9, 10th range Coleraine, 100 acres; in all 379 acres. Lucius J. Boyd, Quebec, is the engineer of the company.

Justice Stirling has granted a petition before the High Court, England, to wind up the Canadian Asbestos and Antimony Company, on the ground that the vendors never acquired a title to the estates sold to the company.

The Glasgow Canadian Asbestos Company are making preparations for a resumption of work at their mines. An excellent quality of the mineral is now being produced.

Our last issue contained a reference to the Scottish Canadian Asbestos Company. We desire it to be understood that no reflection against the management of Mr. John J. Penhale, the able superintendent of the mine at present, was intended.

We are informed that the Excelsior Copper Company has decided to erect smelters at Harvey Hill, and a great quantity of ore will not be raised until these works have been erected. Col. Drew Gay, superintendent of the mines, is at present in England on the company's business.

Major Short, of Quebec, has commenced to open up an asbestos property in which he has an interest in range 9, Coleraine.

The American Asbestos Company is the title of a new private company shortly to be registered in England, and formed by the Wertheims to operate their property in Coleraine. The shares will not be offered to the public for some time, and are not to be quoted on the market. Mr. Louis Wertheim is chairman of the board, and Mr. Edward Wertheim managing director. At a recent meeting it was decided to put in an extensive plant to enable the production of a larger output. Prior to the sale of this property in November last some 60 tons were raised by Dr. Reed, and since it has changed hands a similar quantity has been quarried by a small gang during the winter. The present output is about 30 bags, or 1½ tons per day, but this will be very largely increased as soon as the machinery has been got into working order. Dwelling houses for the accommodation of a strong working force are in course of construction.

An engineer who has just returned from a visit to the Graphite plumbago mines speaks very highly of the new plant and the many improvements which have recently been made to the buildings there. By the way, we hear that the Hon. Mr. Chapleau, when on the continent, succeeded in floating a company to work the concern, but at time of writing we have been unable to ascertain the truth of the statement.

Ontario.

No new oil wells of value were bored in the province last year. The entire production in 1887 was 594,273 barrels, produced from about 2,700 wells, in the county of Lambton. The average depth of the oil rock in this county is estimated to be from 490 to 500 feet from the surface.

The oil well at Comber, Essex county, is 1,300 feet deep and is said to yield about one barrel of oil per diem.

The recent discovery of natural gas in the county of Essex has led to the proposal to form the Canadian Natural Gas Company limited. The incorporators are: N. A. Coste, of the township of Malden; Hiram Walker, Edward Walker, Franklin Walker, James Walker and Chandler Walker, of Walkerville; John Atkinson, of Detroit; John G. Haggart, of Ottawa, Postmaster-General of Canada, and others. The chief place of business is to be at Walkerville, and the total number of shares 25 at \$500 each.

A short time ago Mr. Chas. Moore sold a quarter interest in the Sultana gold mine, Lake of the Woods district, to Messrs. Galt & Bros., of Winnipeg. Recently Dr. Scovil sold a quarter interest to Mr. Hartt, coal merchant, Montreal, for \$2,750.

Sudbury District.

We understand that Dr. R. Beil, Assistant Director of the Geological Survey, will read a paper at the next meeting of the Royal Society upon "The Copper deposits of the Sudbury district."

We have received a copy of the prospectus of the Sudbury Mining Company recently incorporated. The capital stock is stated at \$100,000 in 10,000 shares of \$10 each, payable 25% on allotment, 25% in thirty days, and balance on call after notice of not less than thirty days. The directors of the concern are: Joseph Cozens, Saulte Ste. Marie, president; Robert McClain, Toronto, vice-president; Geo.

Dunstan, Toronto, sec. treas.; Alex. Mackie, Toronto; Lt.-Col. George A. Shaw, Toronto; Thos. E. Johnson, San Jose, Cal. The property proposed to be worked is known as the north half of lot 6, con. 3, township of Denison, consisting of 160 acres. The property is said to contain copper and gold quartz in paying quantities.

The Canada Copper Company's smelting works continue to produce large quantities of matte; 154 tons were given in twenty-four hours lately.

Port Arthur District.

The arrival of the first steamer from Duluth has created quite a stir in mining circles. Americans are evidently keen to get a good hold of the silver and iron finds, and several of the moneyed men are keeping parties of explorers in the Silver Mountain and Arrow Lake region all summer. Applications have also been made for extensive iron lands, in view of the almost certain take off of the American import duty on that article, the necessity for which is daily becoming more apparent.

The lead deposits in Black Bay are also receiving considerable attention.

The Badger, Beaver, Elgin, and Silver Mountain West mines are continuing their steady, uniform, satisfactory progress. The Silver Mountain East is, however, coming to the front again in a very marked manner, the ore from the west shaft being of the exceedingly rich kind which was first encountered in this mine.

The Wolverine mine has been working with such encouraging results that the adjacent "Queen" mining property has started to work again with renewed vigor; supplies, &c., are being teamed over the roads to Whitefish Lake, in spite of the great cost incurred at this season of the year.

The placing of a steamer on Whitefish Lake by the Silver Fox Company is a move which is duly appreciated by property holders in that region. It is not unlikely before the season closes that another will be placed on Arrow Lake also.

The matter of the railroad to the silver mines is the absorbing topic, but unfortunately great delay has occurred from a want of harmonious action of those concerned.

Several gold properties at the Lake of the Woods have recently changed hands, in view of the probable erection of a smelter, which has received a handsome bonus.

It is officially stated that the year's expenses of the Badger, including expenditure for land, mining and improvements are less than \$50,000. From September to February the shipments included three car loads of smelting rock, valued at \$24,000, \$40,000 and \$75,000 respectively; two lots of bullion, 6,269 and 3,916 ounces, value \$9,900. This statement was sworn to before the United States Consular Agent at Port Arthur. Thus the total receipts were \$142,650; total expenditure, \$50,000; net profit, \$92,500.

Manitoba and North-West Territories.

The Lords of the Admiralty have granted an interview to Macleod Stewart, President of the Canada Anthracite Coal company, regarding the use of Banff coal for the Pacific squadron, in lieu of Welsh coal. The Admiralty is arranging to test the fitness of the coal. Mr. Stewart expects favourable results.

The revenue derived by the Department of the Interior from the sale of coal lands in 1888 was \$74,700, being an increase of \$67,050 over the previous year. The total area of coal lands sold up to date is 12,078½ acres, and the total amount received therefor, \$124,508.82.

By an Order-in-Council dated the 10th of February, 1888, the price of lands containing anthracite coal was raised from \$12.50 to \$20, the latter being the price of this class of lands prior to December, 1885. By an Order-in-Council dated the 11th of July, 1888, the regulations for the disposal of coal lands in the Province of Manitoba and the North West Territories were made to govern the disposal of Dominion coal lands in the Railway Belt in the Province of British Columbia.

Returns from the Dominion Lands Agents show that during the past year 29 entries were made for mining locations other than coal. The revenue for mining lands for the year was \$430.75, made up as follows: Fees for entry and registration of assignments, \$231.75, and \$199 in payment of a mining location in British Columbia. The total area of mining locations sold up to date is 1,080.86 acres, which realized \$5,406.50.

The chief output of coal has been at Lethbridge, by the North West Coal and Navigation Company, and has been probably double that of any preceding year. The widening of the gauge of their railway and a connection with the American railway system at Fort Assiniboine would probably lead to a quadruplication of their output. Both of these enterprises will probably be accomplished this year. Within the past few weeks a Diamond drill has been added to the plant at these mines.

The output from the mines at Medicine Hat during 1888 has been meagre; legal complications have retarded operations. These, it is stated, have been adjusted, so that a renewal of operations may be anticipated. The Medicine Hat Railway and Coal Company assert that they will shortly build their railway and develop their coal properties.

The C. P. R. has during the past few months been developing some of its coal lands at Crowfoot Creek, at a point about four miles from the line of railway, so far with very favorable results. Tests are being made with the Diamond drill.

During the past season the original Bow River mine at Cochrane have been closed down; another has been opened with, it is stated, ample capital to back the enterprise, and coking furnaces are to be put into operation. As a coking coal it ranks "A 1," and the establishment of these furnaces should prevent a great deal of waste, which heretofore from its character had to be left at the pit mouth. With proper coking appliances it could be cheaply converted into coke, and a good market in connection with smelting works will no doubt be

obtainable in a year or two, as well as for fuel. The coming year will probably witness several diamond drill tests made in that neighborhood, which it is to be deplored was not made at the inception of mining in that locality.

British Columbia.

The new reduction works at Barkerville consist of a furnace building 75 feet long by 27 feet wide; a mill building 40 feet long by 22 feet wide; a pan room 30 feet long by 22 feet wide; and an engine room 40 feet long by 23 feet wide—all good, strong, substantial buildings. The contract price was \$4,700. The machinery consists of one Kendall stamp mill, capacity five tons in 24 hours; one twenty-horse power engine and boiler; one five-foot improved pan; one six-foot settler; the necessary shafts and pulleys for the above, and door frames, bolts and buckstays for a fifty-foot reverberatory roaster, which has a capacity of three tons of concentrated sulphurets in 24 hours.

The mining population of West Kootenay district numbers about 500 persons, and it is estimated that the capital invested figures about half a million dollars. The product for 1888 was about \$10,000 gold and \$75,000 silver. It is thought that these figures will be largely increased during the present year.

At Weaver Creek Mr. Leonard, a miner of great perseverance, who has stuck all alone to this creek for years, took out last summer about \$5,000 in coarse gold.

The Findlay Creek Mining Company has a first-class ditch and flume about 5¼ miles long and of a capacity of about 700 inches of water. The head at lower end is about 200 feet. The hydraulic plant consists of a 15-inch water pipe, No. 2 giant, and about 400 feet of 30-inch sluice, and has a capacity of about 1,000 cubic yards per day of 24 hours in ordinary gravel. The dead work, through clay and cement, is about finished, and a gravel bank of about 100 feet deep, which prospects well, has been all but reached. It is thought that the bed rock of one of the old channels coming in from the north will be struck in June or July, and that good pay will be the result. The company has erected good houses, a blacksmith shop, storehouses, &c., and has all the necessary tools and appliances to carry on the work; also a circular sawmill of average capacity. A prosperous season is expected this year.

The Perry Creek Gold Mining Company, owing to there being no waggon road to their mines and to the different pieces of metal being too heavy for pack animals, were unable last season to have the machinery for their large pump transported to its destination, and consequently the shaft, which, with much expense, skill and labor, had been sunk to bed rock last year, had to be temporarily abandoned, it being impossible to contend against the water without the aid of machinery. They have, however, during this year concentrated all their energies upon their mining ground known as the "Mount Cenis Tunnel," lower down the creek. This ground is supposed to be rich, but requires a large capital to thoroughly test it. Substantial buildings have been erected, comprising dwelling and boarding house for employes, storehouse, and an office. A dump house has been fitted up, wherein everything, under the able management of their efficient foreman, Mr. Dow, an old Cariboo miner, has been placed in perfect order for the summer's work—stove, dump box,

water heads and gates, and hydraulic air pipes for the tunnel being in place and order. The length of the tunnel, which gives evidence of first class work all through, is now about 580 feet. This tunnel is run at a higher level than the old one, and for the most part goes immediately over it. Pay was not expected till bed rock was reached and the canon through which the old channel originally ran was passed. By latest accounts bed rock had been struck, and although quite smooth, being not yet past the canon, a condition which generally prevents it from retaining the gold upon its surface, a very fair return from the last week's work (only one shift employed) was produced, about \$515 being taken out of the dump box. The company are now sanguine as to the success of their enterprise, to which, in the opinion of all, they are fairly entitled, considering the amount of capital they have invested and the courageous perseverance they have evinced under many difficulties.

The Star Mining Company (Yale district) have shown unusual energy in developing their mine by sinking a shaft 100 feet in depth, at the mouth of which a horse whim and blacksmith shop have been erected. The ledge is 4 feet in width, with a pay streak of about 20 inches. The assays range from \$20 to \$600 per ton.

The Planet mine, which is also the property of this company, is being developed in a businesslike manner. A shaft 40 feet in depth has been sunk, and at the bottom a level has been driven in a northerly direction which exposes a magnificent body of ore which has assayed an average of about \$95 to the ton. The owners of these mines were engaged during the summer in drifting, taking out rock for milling purposes, and shipping concentrates. The rock was hard quartz, showing galena, iron sulphurets and gray copper. The copper did not run over 4 or 5 per cent. The result of several assays of picked specimens, of which the following are two:—576 oz. silver and 2½ oz. of gold per ton; 407 oz. silver and 1½ oz. of gold per ton. The nearest point of shipment is Kamloops, to which place it costs about \$10 per ton to haul. The plant of the Star Mining Company is very complete, but not large enough to be profitable. It consists of a rock breaker and a quartz mill and two Triumph concentrators. The last named have done their work well, but the quartz mill is not a success, owing to the hardness of the rock.

A few days ago the Perry Creek Mining Company struck a rich pocket which yielded in the last wash-up \$1,327.50. A letter from the mine says: The place where we have struck the good pay is a deep hole, the dirt in which was literally full of gold, as it could be seen while handling it in the tunnel. There is a considerable quantity of it still in sight, and we expect still greater things in our next wash-up. The total clean up for January and February was \$3,200.

The Government Immigration Agent at Victoria states that the Belgian colliers who arrived at the mines last year are doing fairly well. Not knowing any English when they commence work in the pits is a great drawback to their immediate usefulness. After this objection is more or less removed by contact with English-speaking miners, their future, with sobriety and industry, is assured. Colliery managers report favorably of their work, care and economy in the use of explosives being one of their charac-

teristics. Three or four of these people lost their lives by the disastrous explosion in No. 5 pit, Wellington, nearly a year ago, but with this exception no other casualty has occurred among them. The opening up of the Comox coal field under the same management as the Wellington collieries will ensure employment for all the Belgian miners and those of other nationalities that are likely to come during the ensuing year.

Phosphates and Agriculture.

(Liverpool Journal of Commerce.)

Every matter connected with the cropping of the lands of any country is embraced in one formula—it is matter reconstructed. In nature's laboratory change is continually taking place; that which existed yesterday exists to-day, but in another form. The growth of a plant or an animal is but matter reconstructed; it may be natural, or nature may be helped by the wisdom and knowledge of man. The growth of plants is reconstruction of matter, which must exist, and be available at a given place—in the position in which it is required—in order that the plant may take it up. The chief constituents which a plant requires are nitrogen, phosphates and potash. In all soils these exist in some proportion. Nitrification is continually going on in every soil, and when the sun shines the nitrification is especially great. Active nitrates are the dearest of all our manures, simply because they are essential in their action on the other constituents of the soil, and because also they are evanescent, for being once in the soil, unless they are taken up at the moment by the plants, they may be washed away by the first shower of rain. They cannot be stored. Phosphates are not continually being formed in the soil, and the limit of its fertility is the amount of this necessary mineral existing in it. Phosphates are brought within the range of plant food by means of the active nitrates in the soil, and one of the great evils of the excessive use of nitrogenous manures, which has been common in English farming for many years, has been that the soils have become exhausted of their phosphates, and to a certain extent of their potash. Nature does not reproduce these, and once they are gone they have to be supplied by the hand of man.

British agriculture is what it is at the present day simply because we have exploited the whole world in our hunt for phosphatic manures. "England," once wrote the late Baron Leibig, who himself was the greatest agricultural reformer the century had seen, "is robbing all other countries of the conditions of their fertility." We have not even spared the graveyards of the gallant soldiers who have fought the battles of the world. But our manure manufacturers are finding that to these even there is a limit, and in December last the manager of probably the greatest existing manufactory uttered the plaintive cry that the phosphatic deposits were getting exhausted, while, at the same time, America is discovering the fact that her soils are becoming unfruitful in consequence of the exhaustion of the natural phosphates. Such excellent deposits as those in the valley of the Somme in Europe and the guano beds of South America, are showing signs of exhaustion and new sources of supply are absolutely essential if our soils are to "go the pace," and produce the large crops which they have for the last 20 years. This new source of supply is already on the eve of development. It is curious that they have not been developed before to day. The wonderful deposits of apatite in the valleys of

the Ottawa River, in Canada, have a richness in phosphate superior to those in any other part of the world. Apple green in colour and as pretty to the eye as any of the precious stones, they yield from 88 to 92 per cent. of tribasic phosphate of lime. The American Government, in the report of the geological survey, places these as the best in the world, and far superior to the phosphatic rock in Carolina, and declares that the future of American agriculture depends upon its development for their development.

The Treatment of Ores.

MILL MACHINERY.

Crushers—The ore, as received from a mine, is usually in large pieces, requiring a preliminary breaking before the succeeding finer crushing. This operation is performed by jaw-crushers, mostly some modification of the well-known Blake rock breaker. This machine is too well known to need description, and is the most desirable form of crusher for stamp mills. The Dodge crusher differs from the Blake chiefly in the fact of the oscillating jaw being pivoted below instead of above; and from this it results that the product is more uniform in size, as the discharge opening remains nearly constant. Where comparatively fine crushing is needed, as for instance, in sampling works or in preparing ore—for rolls—the Dodge is preferable to the Blake. The Comet crusher is an improvement on the Blake as far as capacity is concerned; the motion being rotary, every portion of the stroke is effective. For smelting works and concentration mills, when large crushing capacity is required at one point, the Comet crusher is the most effective yet introduced, being capable of breaking 40 to 50 tons per hour of hard rock.

Stamps.—In gold and silver mills, and some fine concentration works, stamps are used for the final crushing of the ore. Though a simple form of machine there is much greater difference in the results of differently constructed stamps than inexperienced men would anticipate. The form of mortar and cans, the material entering into stems, shoes and dies, and the placing of camshaft and guides, all exert influences of greater or less importance; and experience is alone the safe guide in such matters. It is a common expression that stamps are "crude and clumsy and wasteful," but this opinion is held most firmly by men of little real experience with good mills. For the actual work of crushing, with a clear discharge as in wet mills, the stamp can be scientifically defended as an effective form of the application of power; while in actual practice it has held its own against all competitors for economy and effectiveness. For dry crushing the stamp is not so easy to defend, its capacity being less than in wet crushing, and the matter of dust requiring great experience and care to prevent proving a nuisance.

Still, for fine crushing, on many ores, the dry stamp has not yet been superseded, in spite of the numberless death warrants pronounced against it by inventors of new pulverizers. In some cases fast-running rolls may be preferable to stamps with the limitation mentioned below, under the head of rolls. The great advantages of stamps are as follows:—They are simple to keep in order; easy of repair by an ordinary blacksmith; generally understood; susceptible of almost constant running; capable of being stopped, a few at a time, for repairs, so not delaying a whole mill; the wearing parts are simple castings; when once erected they

will last for years; they are, practically, economical; and when they are put up it is known positively in advance that they will do their work without any risk of failure or delay in starting. For mining purposes these advantages are so great that mining men must be credited with common sense in their continued preference for stamps.

Rolls.—The ordinary cornish rolls constitute an effective, simple and cheap machine for crushing rock after a rock-breaker, either wet or dry. Rolls are mostly used where the crushing is not to be carried very far, as in coarse concentration mills and sampling works. Of late years they have been improved in form of construction and driven at a much higher speed than formerly, and now have their strong advocates as superior to dry stamps, for even fine crushing. For this purpose the shells must be of good material, kept true in surface, and fed regularly and evenly across their full width. In a few cases, crushing to pass a screen of 20 to 30 mesh, rolls have actually been used with great success. There are, however, ores which are clayey in character, on which the success of rolls for fine crushing, is still very doubtful; and sufficient evidence is not available to settle the question of their applicability to crushing any ore finer than 30 mesh. Millmen differ much among themselves as to the need of fine crushing for roasting silver ores, but the general tendency in gold and silver mills at the present day is towards a coarser crushing than formerly employed.

For leaching mills, the use of rolls offers several obvious advantages over that of dry stamps. The limit of the coarseness of crushing is determined here simply by the results obtained in roasting, and the reduced proportion of fine dust produced by rolls greatly facilitates the subsequent leaching process. In amalgamation mills the employment of settlers limits the coarseness of the crushing.

Pulverizers.—During the last 20 years a great number of new pulverizing machines have been invented, brought to public notice, put in limited operation, and, after failure, allowed to drop out of sight. New machines still keep coming out, most of them embodying some fatal weakness which has already ruined previous machines equally promising in their time. The greater part of these machines depend either on the attrition of the rock particles between surfaces of the machine or the crushing of the ore under rapidly running balls or rolls. The weakness in these forms of machines is either in the excessive wear of the grinding surfaces (for no metal can be economically employed as a purely grinding surface on hard rock) or in the wear of the driving portion in roll or ball machines. The use of attrition surfaces will condemn any new machine, however constructed. The most successful roll pulverizer is the Huntington mill, which introduces the novelty of an oiled bearing for the crushing rolls, and a suspension of the same from above, so that the whole wear is on the crushing surfaces, as the rolls run round against a horizontal steel tire. Any advantage there may be in a fast running roll or ball is here obtained with the minimum of power and wear, owing to the use of oiled bearings and a horizontal travel. A vertical revolution is obviously inferior to a horizontal one, because the motion is, in part, against gravity, and, as a consequence, an uneven force is exercised and uneven wear induced, while power is lost.

Huntington Mill.—This is used only for wet crushing, and has been by far the most successful competitor against stamps which has yet appeared. It has in its construction avoided the

fatal defects of previous pulverizers, and represents most nearly a combination of fast running rolls with the mortar and screening advantages of the stamp mill. It has been largely used in California, and its most obvious advantage consists in decreased cost of transportation, from small weight compared with stamps, the practical absence of heavy expenses in erection, and decreased power required to run it. These advantages have made the mill very favorably considered for preliminary work on a mine where distance is great or capital limited. It is the only mill which, for mining purposes, has a record of continuous work on a large scale, and with successful results.

Sturtevant Mill.—This mill has been used in smelting works where very large capacities are required. The machine consists of two cylindrical heads revolving in opposite directions within a screen-lined casing. The heads become filled with a conical lining of the material to be crushed, and these rock faces throw, by centrifugal force, the pieces of ore which fall on them, against the pieces thrown in an opposite direction by the other head. In this way the rock is made to break itself. To prove that this is no theory of the action of the machine, it is possible to feed into it when in motion balls of hardest white cast iron which rapidly smash themselves to pieces without injury to the machine. This mill has been used successfully on some materials to crush as fine as 40 and 50 mesh, by using outside a revolving screen and returning to the mill with the coarse ore, the part not yet fine enough to pass the screen. As a preparatory machine, combining the work of rock-breaker and coarse rolls in one operation, the enormous capacity of this mill offers great advantages. Its wearing parts consist simply of short cast iron cylinders easily replaced.

Another Dobson.

A little over three years ago a Mr. George Henderson, who gave out that he was a mining expert, arrived in this city from Portland, and registered at the Driard. He became acquainted with a number of gentlemen interested in mining matters, and through the combined efforts of himself and an associate a bonus of \$5,000 was placed in the estimates of the session of 1886 for the erection of a smelter. It was proposed to place this at Esquimalt. For some reason or other this project fell through, but Henderson had become acquainted with men of means, and his plausible manner of conversing on mining subjects secured to him their confidence. In the spring of 1886 he heard of a mine on the Fraser, near Big Slide, about 20 miles west of Clinton. He visited it and returned with some of the ore, and spoke in glowing terms of the mine. It was just what he had been looking for, and he could guarantee an immense success if a company was formed for its development. A company was formed, composed of the leading capitalists of Victoria, and a number of miners were imported for the purpose of opening the property up. The results of assays and mill tests of the ore were in favor of Mr. Henderson's theories, and the prospects were bright for the Foster Gold Milling and Mining Company (Limited). Stock was liberally subscribed. A crushing and roasting plant was purchased at San Francisco by Mr. Henderson, who up to the present point had declined to accept salary, thereby increasing his confidence with the

directors. He spoke of the wonderfully rich returns which would be received when the mill was in working order, and the stockholders looked forward with pleasant anticipation to the golden bars that would soon be forwarded to Victoria from the mine. Matters went along swimmingly; roads were built, the works placed in position, and after the supreme moment had been postponed from time to time the crushers and roasters and concentrators began their work. Some difficulty was experienced in working the machinery, but at last Mr. Henderson arrived in Victoria with a piece of flat yellow metal which he said was gold and the product of the mines. He still glowingly danted upon the big yield that was sure to come, and prophesied that shares would advance a thousand per cent. However, he took good care to sell several thousands of dollars worth of the shares allotted to him. Every possible effort was made to successfully work the machinery, but at last it was given out as a failure, and the company closed down the works, after the voluble George had succeeded in getting rid of about \$75,000 of the stockholders' money.

The ore discovered in Nicola then attracted his attention, and George went in and bonded a couple of ledges. He was never known to work himself, his time being occupied in blowing, living on the fat of the land, playing cards and billiards, and smoking fragrant Havanas. He spent the money he had gained through the sale of the shares, and was about "broke" when he applied to several gentlemen formerly interested in the Foster. Surprising to relate, he secured advances, and his first report from the Star mine was to the effect that he had purchased a team of horses and was about to build a house. This was strictly against instructions, and George was compelled to relinquish cash received and the agreement of partnership, and this "deal" was killed.

But his cheek and loquacity were not lost, and he induced other gentlemen to go in with him, and thus secured funds to proceed with work. He sunk a shaft and developed a body of good ore. Then he purchased a small crushing and concentrating plant and a diminutive steam engine, and by dint of making others work hard—he was never guilty of anything of that sort himself—he at last succeeded in getting a car load of concentrates together, which he shipped to San Francisco, and they returned \$40 or \$50 per ton, or about one-fifth of their cost. He returned to Victoria, remained for a few days, and again departed for San Francisco. He has not been seen since. Altogether he managed to run up about \$15,000 debts for his too-confiding associates, Nicola ranchers and others, who would like to see him once more.

During his work in Nicola he brought up quartz miners from Grass Valley, Cal., and failed to pay them a dollar, although he had thousands of borrowed money in his possession, and they and their families were forced to borrow money to return to where work could be secured. Altogether, from a business point of view, Mr. Henderson has made a very bad reputation for himself, and should he ever revisit Victoria the people he has duped and robbed will have the satisfaction of placing him where he belongs—in the meshes of the law.—*B. C. Colonist.*

The North American Chemical and Mining Co. have made application to the Federal Government for a rebate on machinery imported from England for the manufacture of Portland cement.

General Mining.—Accounts to December 31 submitted in April, but an interim meeting is held in November. Dividend for 1884, 5 per cent; for 1885 and 1886, 1½ per cent each year; and for 1887, £4 13s. 6d. per cent. Reserve fund, £2,000.

Louthsburg.—The vendors' shares, up to the end of 1888, do not rank for dividend until 7 per cent. per annum dividends have been paid on ordinary shares. Accounts to Dec. 31. For 1887, 5 per cent. was paid on the ordinary shares other than those held by the General Mining Association, the Company foregoing their dividend rights.

North-Western Coal.—The deferred shares receive on dividend 15 per cent. per annum (cumulative) has been paid on the ordinary shares. Accounts to June 30. Dividend for 1887-8, 5 per cent.

Sydney and Louthsburg Coal.—Accounts to Dec. 31 submitted in May. Out of the profits of 1884 one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,174.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200. Reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £47,000; purchase of consideration, £400,000, in cash or shares. Fully-paid shares issued to the vendor; partly paid to the vendor.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital of £100,000, of which £50,000 was the first issue. Most of the shares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1885. Accounts to October 31 submitted in March. No dividend yet. Debentures, £3,450. Reports are not obtainable, but this information is official.

Anglo-Canadian Phosphate.—The preference shares rank first for 7 per cent., and after a like rate has been paid on the deferred shares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £1,576, which was carried forward.

Nickel Mining.—The nickel industry of the world is a most peculiar one. It has only been about sixty years since it first came into use as a mineral, though it has been known to Japan and the eastern nations for centuries. There are nickel mines in France, Germany and Wales, in Pennsylvania, Nevada and Oregon. Nickel is not, as is generally supposed, a mineral that is mined like silver, and then smelted and reduced from an ore. It is a chemical element which is extracted from arsenides, cobalt and sulphides. The yield from these substances, as found in France and Wales, is only about 2 per cent nickel, but the yield of some mines in Nevada not yet developed is fully 20 per cent. of pure nickel. About thirty years ago there was discovered in New Caledonia, a French penal colony, a wonderfully rich deposit of nickel. A French company was immediately formed, and this company to-day almost controls the trade in this country. It also almost controls the nickel trade of the world, and it has frequently declared its intention to ruin every other nickel manufacturer and run them perpetually out of the business.

The Late Canadian Asbestos and Antimony Company.

The following circular has been issued to the shareholders of the Canadian Asbestos and Antimony Company, Limited. It will be seen that the directors have decided to repudiate the purchase of the properties, and to return in full the amounts received from the shareholders:—

SIR,—I am instructed by the directors of this company to explain to you the delay which has occurred in communicating with you, and which has been unavoidable. From information which the directors received after the allotment of shares had been made, they thought it desirable to obtain, through the Dominion Government of Canada, an official report on the properties to be purchased.

By cablegram from the Government it appeared that the several properties were at the time inaccessible, owing to the ground being covered with snow, and that it would be impossible to report upon them without some delay. The directors thereupon applied to the vendors for an extension of time. This it was not within the power of the vendors to grant except on terms which would have necessitated the directors parting with the control of a large portion of the shareholders' money. Then followed communications between the directors and vendors, the result of which is that the company, acting under the advice of Sir Horace Davy, Q.C., and Mr. Alexander Young, has repudiated the purchase. The directors have resolved to personally defray all outgoings and expenses of the company, which represent in the aggregate a considerable sum, in order that the shareholders may receive back their subscriptions in full, and free from any deduction whatever.

The directors are advised that it is necessary that the company should first be formally wound up, for which proceeding the initiatory steps have been taken. Enclosed herewith is a form for your signature, which the directors will be pleased to receive from you duly signed by return of post. I am desired to express the regret of the directors that you should have had any trouble in this matter, and their hope that you will appreciate their action in protecting, as they have done, the interests which you had committed to their charge.

I am, sir, your obediently,

GEORGE WM. LAKEMAN,

Secretary.

St. George's House, Eastcheap, London, E.C., April 4th, 1889.

Remarkable Rock Drilling.—Several months ago, Mr. Edward Askew started work upon a contract for driving a tunnel at the Suffolk colliery, St. Nicholas, Pa. He reports having driven with two three-inch Allison rock-drilling machines, worked by air-compressors, during the month of January, one hundred and thirty-five and two-thirds feet through hard sandstone and rock, size of tunnel 8 by 12 feet. He claims this remarkable drilling to be unparalleled in history of rock-drilling or tunneling.

The Natural History of Coal.

(Contributed by Francis D. Taylor, M.F., Brockville.)

The subject which I have undertaken is one that is surrounded with considerable difficulty, and will require care on my part not to indulge in mere supposition and hypothesis. I shall purposely avoid the pursuit of many tempting fields of scientific enquiry that might legitimately be regarded as connected with this paper from a desire to make the subject as practical and useful as possible. My aim will not be to astonish or confound but to teach; not to puzzle, but to make plain. I shall therefore try and put into as clear and condensed a form as I can, these truths in connection with the subject of the present enquiry that the investigations of scientific and

practical men have made certain and satisfactory, leaving to others, whose powers of mind, and range of observation are greater than my own, the task of elucidating and developing many important and deeply interesting questions connected with the natural history of coal that are at present obscure and problematical.

I think it will help in the recollection of the subject if I place my observations under the following heads:

First—The geological formations with which coal is usually associated, with some remarks on their character and mode of deposition.

Second—The composition of coal and the circumstances under which it is found.

Third—The present position of coal, and the changes to which it has been subjected.

Fourth—Some general and miscellaneous remarks suggested by the subject, that cannot properly be arranged under either of the above heads.

(1.) Under the first head your attention must be called to the fact that the geological range in connection with the natural history of coal extends from the top of what is called the upper silurian strata to the base of the permian or new red period, a range which embraces the most important, the most wonderful, and the most interesting period of the past geological history of our planet.

Comparing the various rocks of which our earth is composed to the leaves of a book, there is no part of that book more interesting to the philosopher, more important to the student, and more valuable to us all, than the carboniferous range.

The rocks of which the earth is composed, from the ancient granites which form the loftiest mountain ranges of the world, and which often (as in the Himalayas of Asia, the Andes of South America and the Alps of Europe) send their peaks through the clouds, to the recent tertiary strata that form the plains of the North-West Territories of the Dominion of Canada, may be regarded as so many tablets on which the Great Architect of the Universe, has written with the finger of infinite wisdom, and almighty power, the history of the world; and evidently it is the design of the Great Creator that His intellectual creatures should investigate, read and learn the handwriting that is to be found upon the rocks for themselves. It is not merely the language of poetry, but of fact, that we have

"Sermons in stones, and good in everything."

In speaking of those rocks that form the base of the carboniferous or coal-bearing strata, it is well to remark that, while as a rule the mountain limestone usually forms the base, basin or trough in which the coal strata lies, in many parts of the world this great geological formation is absent, while in other cases, both the mountain limestones and the old red sandstones are absent, and we have the coal resting directly on the silurian rocks. This is the case in the marvellous coal field of South Staffordshire, England, and the investigations of Prof. Jukes in connection with this subject, have shown that, while the old red, and lower carbonaceous rocks of the rest of England were being deposited, there was a belt of country stretching from Shropshire, through South Staffordshire, and into Warwickshire that was dry land, and formed an island in that ancient sea.

By observations like these, important facts are arrived at, and the geological history of our earth is developed with as much certainty, and accuracy as the motions of the heavenly bodies, or the results of mathematical calculations.

In Scotland, on the other hand, the coal measures rest on the old red sandstone, the mountain limestone being absent, and this, together with several other facts, prove that the Scotch coal fields are of prior date to most of the English and Welsh coal fields.

The coal fields, including that of South Wales, Dean Forest, Gloucester and Somerset, have many geological features in common, and were evidently formed at the same time and under pretty similar circumstances. Each of these coal fields rests on a base of old red sandstone, a siliceous coarse red and brown conglomerate rock of immense thickness, in many cases from 8,000 to 10,000 feet in thickness.

This rock is peculiarly barren of fossils in this district, though rich in this respect in Scotland, and many other parts of the world, thus giving evidence of having been found in comparatively a shallow sea and during a very rough and stormy period of the world's history. The character of the fossils that have been found, the angular and breccian character of many of the beds that compose this formation, show that where the old red sandstone was formed, the earth was much shaken by volcanic action and the sea agitated by terrific storms. Upon the old red sandstone (in the southern coal fields) rests the carboniferous or mountain limestone, which is from 600 to 1,000 feet in thickness, consisting of dark shales, with immense bands of lime rock. This huge mass is full of organic remains of the most wonderful and beautiful character, and not the least striking and important feature in connection with this formation is the fact that in passing from the old red sandstone to the mountain limestone, a distance of only two or three feet, will suffice to carry you from a very barren strata in regard to fossils to a formation so rich in the evidences of organism and life as almost to baffle our powers of belief.

It is an interesting and important enquiry as to whether the absence of fossils in one strata, and their abundance in the other, is due entirely to the original absence of life; or the subsequent obliteration and destruction of the evidences of that life? Probably both causes have helped to produce this result, for the period of the formation of the old red sandstone was peculiarly unfavorable to the existence of life; and its chemical composition is also most unfavorable to the preservation of life.

(2.) As to "the composition of coal and the changes to which it has been subjected." The vegetable origin of coal has been for many years doubted and disputed, but the evidence on this point, has been so overwhelming and conclusive, that no one of any scientific knowledge now doubts the truth. Among the proofs that can be given of this fact are:

First—That coal contains the same chemical constituents as vegetable products.

Second—That the results of its decomposition and destruction is to produce the same elements.

Third—Coal can be traced through all its stages from vegetable fibre to peat, lignite, brown coal, jet, bituminous coal and anthracite—the different classes of substances chiefly differing in the proportions in which their elements are combined, and especially in the different proportions of carbon they contain.

Fourth—The remarkable traces of vegetable remains in coal, especially in the overlying shales, is proof positive that coal is of vegetable origin.

Assuming that this point is admitted without further argument, let us consider the way in which the great mass, or carboniferous, or coal-bearing strata, was deposited. This formation

of strata is, generally speaking, from 10,000 to 12,000 feet in thickness, taken from its base at the top of the "grit" to the surface of the carboniferous beds, which usually lie unconformable to the new red sandstone. This gives a total thickness of over two miles of coal-bearing strata.

The number of workable seams of coal in different sections of England and Wales (only including those above 2 feet in thickness) are between twenty and thirty in number, and the aggregate thickness of the whole is from 90 to 100 feet, or say 10 feet of coal to every 1,000 feet of carboniferous strata. In the southern coal field it is estimated that the entire thickness of the coal-bearing ground is about 6,000 feet, or a little over one mile in thickness, while in the centre of the Somersetshire coal field (Mr. Radstock) it is about 8,000 feet, or over $1\frac{1}{2}$ miles. There are 27 workable seams of coal at the northern end of this coal field, of an aggregate thickness of 61 feet.

The percentage of coal to coal strata in the Bristol and South Wales coal fields may be taken as nearly equal, the difference in the two fields being rather commercial than geological. In one case in South Wales the seams are fewer, but thicker, more regular, and for steam purposes superior in quality to those of the Bristol coal fields.

The question now is, how this mass of vegetable matter we call "coal" and the matrix or coal strata in which it lies embodied was deposited. For many years it was supposed that all strata in which coal is found was of fresh water origin; but this theory always appeared to contain many difficulties which could not be very well explained. For instance, take the great coal field of Central America, extending, as it does, over an area greater than the whole area of the British Isles, or about 150,000 square miles. The formation of this immense deposit would have required a lake six or seven times larger than the whole of the present vast American lakes united. Of course this is not impossible, but it appears to be highly improbable; and the discovery of marine fossils in the coal strata, has removed some very great difficulties out of the way of our present enquiry. In the northern coal fields there have been discovered in the shales overlying some of the coal seams, the remains of fishes and shells, such as the

Cephalopodous

fish (about $6\frac{1}{4}$ in. long), which is an extinct soft-bodied creature, with the organs of motion arranged round the head.

Then the *Avicula pecten* is another of the

Mollusca.

fauna found in the northern coal shales. They, too, are of marine origin, and are bivalves of the conchiferous order. This class includes that numerous family of mollusca that have shells for their protection like oysters.

Spirifer have also been found in the coal beds

Mollusca.

in Scotland, and as all these fossils are of marine species there is no resisting the conclusion that most, if not all, our coal strata fossils are either of marine or semi-marine origin.

At the same time the smooth, fine-grained and beautifully laminated shales of our coal formation show that its deposition was free from those violent agitations of sea action which marked the period of the old red sandstone. And, looking at all the evidence afforded, both by the fossiliferous and chemical character of our coal shales, it looks as if it were due to depositions placed in vast lakes or inland seas, which formed receptacles for land floods and river drainage, and at the same time were open to tidal action of the sea. This view removes a mass of difficulties that otherwise would stand in our path, and makes the question much clearer and freer from doubtful hypothesis.

Having arrived at the conclusion that coal is a vegetable formation and coal shales (or the matrix in which coal is found) are of marine or semi-marine origin, we are now in a position to enquire how the coal beds and the shales came into their present position and relationship, and in no way can the phenomena be accounted for but upon the following principles:

First—That each bed of coal once formed, the surface of the ground.

Second—That there was a gradual depression or alteration of level that gave an opportunity for the deposition of the intervening strata.

Third—This theory, of course, supposes that the depression or sinking of the strata was stayed periodically for a sufficient length of time to allow each coal bed to form.

And this, again, involves a fourth point, namely, that the process must have been slow and gradual, and the period required to form the whole immense.

To make the matter clear as to the process by which coal was formed, it is desirable to begin at the first or lowest bed of the series, and will again refer to the strata of 6,000 feet before mentioned. In the centre of this southern coal field the veins lie at a depth of 5,000 or 6,000 feet (or over one mile) below the level of the sea, and yet according to the theory propounded the present position of this bed of coal must have been once the surface of the ground and the site of a vegetable formation that baffles conception or description. And when it is understood that the thickest forest the world has ever seen would hardly suffice to produce a bed of coal 3 feet thick the wonder is increased.

Further on reference will be made to some of the atmospheric and other conditions that probably assisted in the production of this marvelous flora, but for the present we will confine attention to the formation of coal rather than the peculiar circumstances under which it was formed and the flora of which it is composed.

The reader will please suppose a luxuriant, rank and peculiar tropical vegetation, covering the surface of the ground on which it grew in vast abundance and great variety—ferns (the largest number of species of which are now extinct), over 200 species of which have been discovered in the different coal fields in the world. Then judge of the vast preponderance of this

flora in the carboniferous era. The whole British Isles to day only produce about 50 species now of ferns.

The most numerous family were the *Pecopteris*, or comb leaf fern, of which there are in the coal measures about 60 species.

Sphenopteris, or wedge-leaf fern, of which there

about 28 species. This plant has a wedge-shaped leaf.

Neuropteris, or nerve-leaf fern, of which there

are about 25 species. The best illustration of this class of flora is to be found in Ceylon, the islands of the Pacific and the Indian Archipelago.

Calamites, a reed. These are very abundant

in the coal measures. They are reedlike in form. This family are now found from the extreme north to the equator, but they differ essentially from the fossil calamite, in the absence of a sheath that encircled the present trile at the joints. The calamite generally occurs leafless, and in the fossil state often reaches from 20 to 40 feet in height.

Sigilaria, a seal, so called from the seal-like impressions on its trunk; roots or trees grow from 20 feet to 70 feet high, and from 1 to 5 feet diameter.

Stigmaria, roots of the *Sigilaria*.

The *Sigilaria* is a most important and abundant species. This plant was the most abundant and probably the most remarkable of the carboniferous period. About 60 species have been discovered. They had a conical stem; deeply

furrowed; not jointed with scars; each furrow arranged in vertical columns. The scars are supposed to be the point at which the leaves of the tree were connected with the stem. The height of these trees often reached 60 or 70 feet, and they have been discovered 7 or 8 feet in diameter at the base, and sometimes standing in an upright position. The plant called the *Stigmaria*, of which the underclay of nearly all coal seams is full, is now proved to be the root of this important plant. There are no living species with which we can identify the *Sigilaria*. Brongniart, the French naturalist, has, however, discovered, by a very careful examination of the tissues of the plant, that it belongs to a peculiar family of "coniferous trees," and was therefore of a high order of vegetation.

Lepidodendron, or scale tree, was another

abundant and large sized plant of the carboniferous age. These trees have been found in many places from 30 to 40 feet in length, and, notwithstanding their vast size, Brongniart has shown that this species belong to the *Lycopodium*, or club moss species of our own heaths.

Lycopodium—

Natural size.

But the largest species now known are in New Zealand, and there they only reach the height of 2 or 3 feet. There are about 40 species of this in the fossil flora. The stem looks scaly, hence the name, and may be easily distinguished. The trunks of this plant often con-

tain seed vessels called *Lepidostrophi*, and these seed vessels are found parallel to the tree.

The presence of coniferous trees, which are allied to pine more than the European firs (no sketch) prevents classing the coal flora as low in the scale of vegetable structure, the coniferous ranking high; thus proving that, while no doubt the great bulk of the flora of the carboniferous period was of a lower organism than the present, that there was also flora of a high order.

Try to conceive the growth of these vast preadamite forests, covering, as they did, the marshy, low, swamps of our globe, and that through these forests there crawled few reptiles, whose remains

have come down to us, with some few insects or other creatures.

Try to think of this dense, dark, untrodden, unexplored forest, growing for years and centuries, perhaps, to the wonder of the beings who inhabit other worlds, to whom, perhaps, the Almighty explained that in ages yet to come He was going to create a being to inhabit this world whose organism and wants would be different to theirs, and that one of his wants the mineral we call coal; and that these forests were to be covered up, so that in their decay and preservation this future want of the future inhabitants of our world might be supplied (this ought not to be regarded as fancy); and then think of vegetation being submerged and covered with a fine muddy deposit, which, when hardened, formed our coal shales.

Think of this, and you will understand how the formations of coal and the strata of coal in which it is embedded are formed.

And the vegetable formation having become sufficiently extensive and dense, a sinking of the country takes place, and over the vegetation which has been described the sea flows, and vast rivers and streams from the adjoining country pour in their waters, bearing in their course the detritus of the rocks over which they have passed. This deposit, with portions of the vegetable structure which it covered, formed the black, grey and white carbonaceous deposits called coal shales.

(To be continued.)

The Utility of Mica for Electrical Purposes.—Mica is used very largely in connection with electric plants. Its lightness and value as an insulating material has, especially for commutator use in dynamos, motors, &c., superseded all other materials. The color of the mineral, unless largely caused by iron association, does not affect its value for electrical uses.

A Mechanical Slate Picker.—There are half a dozen devices patented, some of them being in successful operation, for separating the slate from the coal in our breakers. Of all inventions, the simplest yet planned is that recently exhibited as the joint contrivance of Mr. Thomas E. Phillips, superintendent of the Lehigh and Wilkes-Barre Coal Company, and John E. Evans, a miner of Wilkes-Barre. The apparatus is the perfection of simplicity. A common chute having a sheet-iron bottom, is placed beneath the screens, and into this the coal and slate fall. Four or five feet down the screen the bottom bulges up in a sort of ridge crosswise of the chute. The sliding pieces of coal and slate are slackened in their speed by this ridge. Just below the ridge there is a hole through the bottom of the chute, crosswise, and six or eight inches wide. Beyond this opening the bottom of the chute consists of a piece of sheet iron, which may be moved so as to leave the opening narrower or wider. This piece may also be raised or lowered. The sliding pieces of slate, being heavier and rougher than the coal, are slackened in their speed so that they drop through the opening. The coal being lighter and more glassy, slides so swiftly as to jump over the opening and continues on down the chute into the bunkers. The appliance is a wonder of effectiveness, simplicity and cheapness, its cost being little more than a plain chute. It is to be put into one of the large breakers for a test, and its operations will be watched by all the superintendents of the anthracite region, as they have great confidence in it.

Lidgerwood Improved Hoisting Engines.

One of the best known establishments especially devoted to the manufacture of hoisting machinery and boilers in the United States, is that of the Lidgerwood Manufacturing Company, 96 Liberty street, New York, N.Y. This firm manufacture a great variety of hoisting engines, with and without boilers, single and double, for mining, manufacturing and general hoisting purposes; also hoisting locomotives, improved pile-driving derricks and high-speed geared coal hoisting engines. By additions of special tools

engine is used largely, and is recommended for use in connection with the tail-rope system, double track inclines, or double compartment shafts. It is also especially well adapted for hoisting and conveying material by means of a suspended wire cable. Both drums are loose on the drum shafts, and entirely independent of each other in operation. They may be thrown in and out of gear with the engines in motion, either separately or together, or one drum may be lowering while the other is hoisting; or both drums may be thrown into gear, and the engine used as a regular reversible engine, one load being hoisted while the empty cage is being lowered. The obvious advantage of this style

versible link motion hoisting engine) made by this company in the position of the friction drums and the arrangement of the brake levers for handling same. The patent friction drums are of large diameter, and placed one ahead of the other. This arrangement of the drums admits of leading the ropes nearly straight to the head frame, and will be found suitable for those places where the former engine will not answer on account of its width. The drums are spirally grooved for wire rope, and simple, durable and effective. The reverse friction and brake levers are placed in front of the engine, arranged to work in a vertical position, and have the usual thumb-latches engaging with notched qua-

LIDGERWOOD IMPROVED HOISTING ENGINE FOR MINES.

and labor-saving appliances and improvements and alterations in designs they have increased the good quality of their machines, and now offer them as the standard, modern high-speed hoisting engines, both as regards high duty and economy, durability and simplicity, combined with ease and rapidity of operation. A type of hoisting engine manufactured by them, which is especially adapted for mining purposes, and which is meeting with great success throughout the mining regions of both North and South America, is shown in the engraving on this page, which represents their improved double-friction drum and brake, and reversible link motion hoisting engine for mining work. This

of engine for the tail-rope system is evident, for as one drum being thrown into gear winds up the main rope, the other drum being out of gear and loose on the shaft pays out the tail-rope, while by reversing the engine the tail-rope is wound up and the main rope paid out. This is done with the minimum of friction and wear on the engines. The same independence of drum action is also very desirable at times on inclined and mine shafts, under either of which condition the engines will work with perfect satisfaction. In general design the engine is solid and compact, and is intended for high speed and large hoisting duty. It differs from the original style (double friction drum, and brake, and re-

drants, so that they will stay in any position desired. This is a great convenience, and contributes materially to the easy and rapid handling of the machine. The brakes are of the band type, and are self-acting and very powerful, so that they simply have to be applied by the hand levers and do not require any great pressure. There are over 5,000 hoisting engines manufactured by the Lidgerwood Manufacturing Company in use, and all give perfect satisfaction.

The company have just issued a new catalogue, finely illustrated, describing their various styles of engines, which they will be pleased to send to those making application for same.

The Yukon Gold Region.—From the Report of the Minister of the Interior just published we learn that recent exploration has shown that this district has a much greater value than was previously supposed. It would seem that for gold the best paying streams so far as discovered are in Canadian territory. About 300 miners were in the country in the summer of 1887, but it is difficult to say what amount of gold they have taken out, as they are somewhat reticent on the subject. They all agree, however, that \$8 per day is poor pay, hardly enough to cover expenses. Taking this as an average, they cannot have made less than \$500 each, or \$150,000 altogether. Obtained with the crudest and most primitive appliances this result shows what may be expected so soon as communications with the interior become more easy, and the importation of improved mining machinery possible. Drift coal was found at various places, indicating the existence of seams further up.

SCIENTIFIC AMERICAN

ESTABLISHED 1845

Is the oldest and most popular scientific and mechanical paper published and has the largest circulation of any paper of its class in the world. Fully illustrated. Best class of Wood Engravings. Published weekly. Send for specimen copy. Price \$3 a year. Four months' trial, \$1. MUNN & CO., PUBLISHERS, 371 Broadway, N.Y.

ARCHITECTS & BUILDERS

Edition of Scientific American.

A great success. Each issue contains colored lithographic plates of country and city residences or public buildings. Numerous engravings and full plans and specifications for the use of such as contemplate building. Price \$2.50 a year, 25 cts. a copy. MUNN & CO., PUBLISHERS.

PATENTS

may be secured by applying to MUNN & CO., who have had over 40 years' experience and have made over 100,000 applications for American and Foreign patents. Send for Handbook. Correspondence strictly confidential.

TRADE MARKS.

In case your mark is not registered in the Patent Office, apply to MUNN & CO., and procure immediate protection. Send for Handbook.

COPYRIGHTS for books, charts, maps, etc., quickly procured. Address

MUNN & CO., Patent Solicitors,
GENERAL OFFICE: 301 BROADWAY, N. Y.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Post Office, etc., Almonte, Ont.," will be received at this office until Wednesday, 24th April, 1887, for the several works required in the erection of Post Office, etc., Almonte, Ont.

Specifications can be seen at the Department of Public Works, Ottawa, and at the office of Mr. Andrew Bell, C.E., Almonte, on and after Wednesday, 10th April, 1889, and tenders will not be considered unless made on form supplied and signed with actual signatures of tenderers.

An accepted bank cheque payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party declines the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, April 4th, 1889.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Toronto Works," will be received at this office until Friday the 3rd day of May next inclusively, for works at the Eastern entrance to the harbour of Toronto, in accordance with the plans and specification to be seen on and after Friday, the 19th inst., at the office of the Resident Engineer, 25 Toronto Street, Toronto, and at the Department of Public Works, Ottawa.

Intending contractors are requested to bear in mind that tenders will not be considered unless made on the printed forms supplied and accompanied by a letter stating that the person or persons tendering have carefully examined the locality, have satisfied themselves as to the nature of the materials to be dredged, and the facilities which exist for procuring the materials required for crib-work, etc.

Tenders must be signed with the actual signatures of the tenderers.

An accepted bank cheque, not limited as to time of payment, for the sum of \$20,000, payable to the order of the Minister of Public Works, must accompany each tender. This cheque will be forfeited if the party declines to enter into a contract when called on to do so, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 15th April, 1889.

TENDERS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Indian Supplies," will be received at this office up to noon of

THURSDAY, 9th MAY, 1889,

for the delivery of Indian Supplies during the fiscal year ending 30th June, 1890, consisting of Flour, Bacon, Groceries, Ammunition, Twine, Oxen, Cows, Bulls, Agricultural Implements, Tools, &c., duty paid, at various points in Manitoba and the North-West Territories.

Forms of tender containing full particulars relative to the Supplies required, dates of delivery, &c., may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.

Parties may tender for each description of goods (or for any portion of each description of goods) separately or for all the goods called for in the Schedules, and the Department reserves to itself the right to reject the whole or any part of a tender.

Each tender must be accompanied by an accepted Cheque in favor of the Superintendent General of Indian Affairs on a Canadian Bank, for at least five per cent. of the amount of the Tender, which will be forfeited if the party tendering declines to enter into a contract based on such tender when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted, the cheque will be returned.

Each tender must, in addition to the signature of the tenderer, be signed by two sureties acceptable to the Department for the proper performance of the contract.

The lowest or any tender not necessarily accepted.

This advertisement is not to be inserted by any newspaper without the authority of the Queen's Printer, and no claim for payment, by any newspaper not having had such authority will be admitted.

L. VANKOUGHNET,
Deputy Superintendent-General
of Indian Affairs.

Department of Indian Affairs,
Ottawa, April, 1889.

Diamonds, Jewelry, Watches & Silverware

INSOLVENT NOTICE.

In the matter of **BRADFORD L. NOWELL & Co.**, of the City of Montreal, Insolvents.

Lands and Phosphate of Lime Mining Rights in the Province of Ontario and Quebec for Sale by Authority of Justice.

I am instructed by the undersigned Curator to sell by Public Auction, within my Sale Rooms, No. 1747 Notre Dame St., on

Tuesday, the 28th day of May next,

At 11 o'clock in the forenoon,

All and singular those certain tracts or parcels of land and premises situate, lying and being in the Township of Loughborough, in the County of Frontenac, in the Province of Ontario, and more particularly described as follows, to wit:

Lot No. 1.

Ninety acres, more or less, of the North part of lot Number Six, in the Tenth Concession of the said Township, described as follows: commencing at the North-East angle of said lot, thence West the width of said lot or thirty chains, thence South along the side line thirty chains, thence East thirty chains, thence North thirty chains to the place of beginning. Together also, with all mines and quarries of metals and minerals, in or under the land upon that portion of said lot being West of the West Bay or Gold Lake, whether already discovered or not, with liberty of ingress, egress and regress for the purpose of removing the same only.

Lot No. 2.

All the Phosphate of Lime in and upon lot Number Ten, in the Eleventh Concession of the said Township of Loughborough, with full, free, irrevocable sale and exclusive license to mine and work all and every or any of the mines, veins and seams of Phosphate of Lime opened as well as unopened in, under or upon the said lot with out interruption, claim or disturbance from or by the Proprietor of said lot or any other person whomsoever, and to carry away and dispose of all such Phosphate of Lime as may be found therein, to and for their own use and benefit and for the purpose aforesaid to sink and make shafts, pits, levels, trenches, ways, gates and watercourses, and to erect and use any machinery, workmen's or other houses, and to use all lawful ways and means whatsoever for finding and removing the said Phosphate, and also to take and use sufficient groundroom, heaproom or pitroom, for placing the said Phosphate and for leaving the waste, refuse or rubbish to be from time to time produced from the said mines, and also with the full and free liberty to erect, construct or use any part of the said premises, or any roads or ways therein for any purposes connected with the said mines, and the removal, sale and delivery of the produce thereof, provided in so doing they do not injure the crops or other property on said lot.

Lot No. 3.

All the Phosphate of Lime and the full rights to mine the same in certain parcels or tracts of land situate, lying and being in the Township of Buckingham, in the County of Ottawa, in the Province of Quebec, comprising 200 acres more or less, and being west half of lot 21, and east half of lot 22, of the Eleventh Concession of the said Township of Buckingham. These rights are wholly undeveloped, no mines having as yet been opened on the property.

The lots will be sold separately, subject to existing mortgage and the reservations, limitations, provisions and conditions expressed in the original grant from the Crown.

Terms cash, or half cash, and the balance on approved security at three and six months.

All information can be had on application to the undersigned,

SAMUEL C. FATT,
Curator.

WILLIAM H. ARNTON,
Auctioneer.

FRASER BUILDINGS,
43 St. Sacrament St.,
Montreal, 25th March, 1889.

ASBESTOS Cloths, Packings, Furnace Cements, Paper, Stove Linings, &c.
SPECIALTIES: FIREFELT, a flexible Asbestos Sheet, made in tubular sections and rolls, best and most durable non-conductor made.
SUPERATOR, a strong fire & waterproof fabric for suitable sheathing & roofing buildings, fire proofing boiler rooms.

Minning Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

ESTABLISHED 1878.

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed, we can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888 concerning the fertilizers.

E. MIALL,
Commissioner.

January, 1889.

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have
used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force
thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet
from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler,
and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly,

F. L. BARTLETT."

**ONTARIO
Mining Regulations.**

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or stake out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

A. S. HARDY,
Commissioner.
Department of Crown Lands, Toronto.

PHOSPHATE LANDS.

South half Lot 10, 9th Range, Buckingham, or the Mines thereon, will be sold out and out cheap for cash. One mile from the River, five from Buckingham Village. Good roads; three good "Shows" and several smaller ones.

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Apply to

ALEXANDER CAMPBELL,

Annapolis Royal, N.S.

Handling Rock.—A cubic yard of hard rock in place or before being blasted will weigh about 1.8 tons, or 150 lbs. per cubic foot, if sandstone or conglomerate; if good compact granite, gneiss, limestone or marble, 168 lbs. per cubic foot, or 2.0 tons per cubic yard. A cubic yard of any of these in the solid will, when broken up by blasting, for removal by wheelbarrows or car's, increase 0.8 or 1/3 in bulk, whereas average earth, when loosened, increases to but about 1.2 or 1 1/2 of its original bulk, when in place; although after being made into embankment it eventually sinks into less than its original bulk. In estimating for earth, it is assumed that 1/4 of a cubic yard in place is a fair load for a wheelbarrow. Such a cubic yard will weigh on an average 2,430 lbs., or 1.09 tons. Therefore 2 1/4 x 2,430 or 174 lbs., or 2.31 cubic feet is the weight of a barrow load. Assuming that a barrow of loose rock should weigh about the same as one of earth, we may take it at 1/4 of a cubic yard, which equals 4 1/2 x 36 or 177 lbs. or 2 cubic feet of loose rock. The quarrying of average hard rock requires from 1/4 lb. to 3/8 lb. of powder per cubic yard in place. But the nature of the rock, the position of the strata, etc., etc., may increase it to 1/2 lb. or more. Soft rock frequently requires more powder than hard. A good churn driller will drill from 8 to 12 feet in depth, of holes averaging 2 1/2 feet deep and two inches in diameter, per day, in average hard rock, at from 12 to 18 cts. per foot. A cart load of rock may be taken at 1/3 of a cubic yard in place. This will weigh, on an average, 851 lbs., or but 41 pounds more than a cart load of average soil.

Quartz as an Insulator.—At the Physical Society, recently, in London, Mr. C. V. Boys read a paper on the insulating properties of quartz, which, it appears, are far higher than those of glass, while the former material has the enormous advantage of being practically non-hygroscopic. Since, moreover, the quartz, when once it has been melted, can be worked very much more easily than glass, this discovery of Mr. Boys ought to prove of great value in the construction of electrostatic instruments. Mr. Boys stated that even if the quartz was dipped into ammonia, or boiled in a solution of potash, it only required washing with water to completely restore its insulating properties, and when it was raised to a red heat these properties were recovered on cooling. Some quartz, which the author kept for a considerable time in fused potash, did lose its insulating properties to a certain extent, as was to be expected; but even after this treatment the quartz remained a better insulator than glass.

Removal of Ice in a Down Cast Shaft.

—The ventilating machine used in the coal mines at Zauckerode, in Saxony, send down about 80 cubic metres of air a minute, which, in winter, forms masses of ice near the foot of the shaft. Until recently this formation was removed by the night force with a pick-axe. This was not only a dangerous task but one that presented great difficulty on account of the solid character of the walls of the shafts. Efforts were made to introduce jets of steam, but these only increased the deposits of ice already formed. Recently it was decided to attempt a new system consisting of a number of heated tubes, 70 millimeters in diameter, constructed in such a way as to contain a mixture of steam and air. This method proved a perfect success and the formation of ice was stopped.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

Vol. VIII.

MAY, 1889.

No. 5.

The White's Asbestos Company.

We hear a good deal of unfavourable comment upon the prospectus of the White's Asbestos Company, a brief summary of which was published in our last issue. Like many other ventures now upon the market the price asked for these undeveloped lots seems to us excessive, while the estimates of production and profit cannot be regarded by those conversant with the industry, and the location of this property, other than extremely visionary. As a matter of information we are curious to know what are "the mines in the immediate neighbourhood of the property which yield an average production of 350 tons per annum," and also upon what grounds Mr. Lucius Boyd bases his estimate of an annual output from *each* of these South Garthby lots "of not less than 350 tons." If this gentleman will put on his spectacles and look carefully at the map of the asbestos region he will be surprised to find how many miles really intervene between his property and the Thetford and other producing mines.

It is the custom, nowadays, of vendors of asbestos lands and quarries to lay a great deal of stress upon the very high figures which are now realized for "*First*," and the profits of the Bell's, and similar successful concerns, are strongly emphasized in their prospectuses as an inducement for investment. It is high time that this fallacy was exploded. A comparison of the statistics of the annual production of Canadian asbestos will show that "*First*" hardly form *one-fourth* part of the general output, while "*Thirds*," which at present it hardly pays to work, constitute at least *one-half*. It would be well, therefore, if promoters would, in their statements to the public, give more prominence to the necessary production of "*Seconds*" and "*Thirds*," instead of basing their estimates of profit *entirely* upon an output of *First* quality as at present. It is also worthy of note, that while the Serpentine area, so far as explored, is extensive, it contains large sections which are utterly barren and worthless for asbestos producing purposes. Investors will find it to their profit to look carefully and cautiously at many of the schemes now upon the market.

The Nature and Origin of Deposits of Phosphate of Lime.

We have before us a Bulletin of great interest to all those in any way interested in phosphate mining, and the uses of phosphate as an agricultural fertilizer. Wheat contains eight

tenths per cent. of phosphoric acid, or about 16 lbs. to the ton, and a very little calculation will show the enormous amount of this actually carried away annually from our land in the large quantity of grain shipped every year from the port of Montreal. The most available source of resupplying this plant food to the soil are concentrated natural deposits, such as Canadian apatite when chemically treated, or in the crude finely pulverized condition. The immediate results from the latter are now a question to be solved by experiment, but whatever conclusion is arrived at, apatite itself is an acknowledged necessity, and that in yearly increasing quantity, which must give an impetus to the phosphate trade.

In the introduction on page 9 of the above Bulletin, by Prof. N. S. Shaler, Boston, the geographical history of phosphate deposits receive considerable attention, and in the main portion of the publication the article on their nature and origin by Dr. R. A. F. Penrose, contains material that will throw much light on the subject generally, and especially on our Canadian phosphate areas. In fact it contains a concise history of really all the known workable deposits in Canada, and copious notes on the same. Dr. Penrose, who is now State Geologist at Austin, Texas, was for several years connected with the Anglo-Canadian Phosphate Company, at Perth, and these investigations were made entirely at his own expense.

We know of no other publication which more clearly describes the whole phosphate country, and all other sources of supply are equally well set forth. The work is, moreover, illustrated with numerous diagrams, showing the veins, pockets and distribution generally in various pits or mines now being worked. Tables of analysis will be found at the end, showing the qualities of ground, and the phosphates of the various countries as analysed are reported in tabular form with their component concomitants. We strongly recommend the perusal of this Bulletin to our readers, and regret that want of space will not allow us to quote in detail from its pages.

It should be mentioned that this report, although designed as a memoir of the U. S. Geological Survey, was used in manuscript form by Dr. Penrose as his thesis for the degree of Doctor of Philosophy at Harvard University.

The Frontenac Mineral Country.

We have been favoured with the full text of an admirable paper by Mr. J. Bawden, read before a recent meeting of the Kingston Board of Trade. Mr. Bawden describes at some length and in an able and interesting manner the various mines and the mineral wealth which form a characteristic feature of the country. In the opening of the paper reference is made to the phosphates of the Township of Longhoro, and to the mines in operation at Bobb's Lake and other sections of the county. It is pointed out with a great deal

of truth that much could be done to further the development of this wealth by macadamizing and improving the country roads, and by the abolition of the tolls on the Perth road over which the greater portion of the mineral has to be hauled. We are glad to see that steps have since been taken to urge the necessity of having these improvements carried out. The mica, plumbago, and the extensive iron deposits are fully described, particular emphasis being laid upon the losses which have been incurred by the ignorant and unsystematic methods of working hitherto pursued by some of the miners. It is pointed out that not only has no attempt been made to call in the aid of scientific and practical engineers in guiding the operations of the diamond drill, but it is the fact that the very cores which have been raised from depths varying from 50 to 300 feet, and which would give evidence of some value, have been scattered indiscriminately among the rocks. Mr. Bawden commends the process of treating iron ores generally adopted in Sweden, whose prominent excellence in this industry is due to the careful preparation of the ore for the furnace, to the purifying influences of charcoal fuel, and to the skill of thoroughly trained and competent engineers. An excellent paper concludes with the following suggestions:

"The rapid destruction of the forest in the Northwestern States should be an incentive to the protection of our own when we see it is the fact that charcoal iron and steel made from charcoal iron heads the price lists the world over. Notwithstanding all the advance of the past ten years no branch of iron and steel manufacturing industry is to-day in a more flourishing condition than that which lives by forest fuel, and it is of the very nature of things that while this fuel is obtainable its greater cost will be fully repaid by the higher price obtained for the iron and steel produced by its aid. The very best service which can be done to the northern settlements of Frontenac is to make the existing forest yield a supply of fuel which at the furnace mouth will be transmitted into one hundred dollars cash by the produce of every acre of woodland."

Another matter of policy I urge you to press upon the government is the withdrawal of all crown land from sale pending the examination proposed. At its conclusion the government will have much valuable information to guide its future policy. A portion of the territory examined might be put up at auction to the highest bidder and good prices obtained for it. Other portions might be granted free on condition that the grantees shall establish furnaces, chemical works or other branches of mining manufacture. In either case the country will be richer by such a policy than by selling mineral land as at present for \$1 an acre—a policy which affords a premium upon speculative holding and is a bar to enterprise.

These suggestions, we are glad to see, have been made the subject of a Memorial to be submitted by the Board of Trade to the Ontario Government.

Canadian Mineral Production in 1888.

The preliminary statistical summary of the mineral production of the Dominion annually published by the Geological Survey has been issued, and is reproduced here for the benefit of our readers. A comparison with the returns of previous years will show that satisfactory progress has been made. The total estimated production is quoted to have been about \$16,500,000, or an increase over the previous year of \$1,500,000, and \$5,970,639 more than in 1886. Of course this statement is still incomplete, and

subject to revision; when full returns have been made we are confident that it will be found that the progress has been even more marked than the summary indicates. The following are the figures which have this year been collected and compiled by Mr. H. P. Brumell:

Name of Product.	Quantity (a).	Value (b).
Antimony ore (exports) tons.	352	\$6,894
Arsenic. " "	30	1,200
Asbestos (c) " "	4,404	255,007
Bricks " " thousands.	165,265	1,033,721
Building stone " " c.yd.	387,164	561,197
Cement " " bbls.	50,668	35,593
Charcoal " " bush.	233,648	15,703
Coal " " tons.	2,658,134	5,259,832
Coke (d) " " "	45,373	134,181
Copper (e) " " lbs.	5,562,864	667,543
Fertilizers " " tons.	548	21,600
Glass " " "		150,000
Gold (f) " " ozs.	58,957	1,058,610
Granite " " tons.	19,172	63,846
Graphite " " "	150	1,200
Grindstones " " "	4,936	42,159
Gypsum (g) " " "	175,887	179,393
Iron (h) " " "	40,962	1,442,974
Iron ore " " "	44,410	139,393
Lead (fine, contained in ore) " " lbs.	674,500	27,472
Lime " " bush.	2,213,464	339,541
Limestone for iron flux " " tons.	15,577	14,742
Manganese ore (i) " " "	1,782	47,243
Marble and Serpentine " " "	215	3,110
Mica " " lbs.	29,025	30,207
Mineral Paints " " gals.	1,497	11,750
Mineral Water " " tons.	124,850	11,456
Miscellaneous clay products " " "		350,370
Petroleum (j) " " bbls.	695,200	716,057
Phosphate (r) " " tons.	22,485	242,285
Pig Iron " " "	18,191	226,443
Platinum " " ozs.	1,200	4,800
Pyrites " " tons.	51,764	232,938
Salt " " "	44,581	143,804
Sand and gravel (exports) " " "	260,929	38,398
Silver (l) " " "		368,396
Slate " " tons.	5,314	90,689
Soapstone " " "	140	280
Steel " " "	9,508	470,819
Sulphuric acid " " lbs.	7,143,210	97,755
Tiles " " thousands.	7,518	114,057
Whiting " " tons.	200	240
Estimated value of mineral products not returned (principally rolled iron and glass) " " "		1,847,102
Total " " "		\$16,500,000

(a) Quantity marketed, except when otherwise specified. The tons are of 2,000 lbs.

(b) Market value, less charges of transport from point of production.

(c) There was no production from Ontario this year, but there was an increase of 185 tons from the mines of the Eastern Townships.

(d) Oven coke; all the production of N. S.

(e) Copper contents of Capelton ores at 12 cts. per lb. at the mine.

(f) Nova Scotia gold is calculated at \$19.50 per oz., and that from British Columbia at \$17.00.

(g) Production of New Brunswick and Ontario, plus Nova Scotia exports.

(h) This includes four rolling mills, one forge and the London-derry Iron Works returns have no yet been received from six similar works, thus rendering this statement very incomplete. The total manufactures of iron will, however, be much larger than those of last year.

(i) New Brunswick production plus Nova Scotia exports.

(j) These figures are calculated from the inspection returns at 38 galls, crude for 38 galls, refined oil, and are computed at \$1.03 per bbl. of 35 Imp. galls. The barrel of refined oil inspected was assumed to be 42 Imp. galls.

(k) Direct returns. The production is divided as follows:—

Ottawa County mines..... 20,336 tons,
Ontario mines..... 2,089 "

Total..... 22,425

The exports as per Customs Department returns were 18,776 tons valued at \$3,981,609.

(l) Exports plus silver contained in Capelton ores. Some returns yet to be received.

The Late Hon. Robert Dunsmuir.

General sorrow and regret has been caused by the sudden demise of the Hon. Robert Dunsmuir, president of the Council of British Columbia and owner of the Wellington and other extensive collieries in that province. He was born in Hurlford, Ayrshire, Scotland, in August, 1826, and was therefore in his 63rd year. He was the son of Mr. James Dunsmuir, a proprietor of coal mines in that locality, but being early left an orphan was brought up by his uncle, Mr. Boyd Gilmour, with whom he came to British Columbia in 1851. Mr. Gilmour was employed by the Hudson's Bay Company to prospect and open up mines for them on Vancouver Island, which resulted in the discovery of the collieries now owned and operated by the Vancouver Coal Company (Limited). On Mr. Gilmour's return to Scotland in 1853, Mr. Dunsmuir was left sole manager of the mines and continued to fill that position for many years to the satisfaction of the company. In 1865 he was induced to accept the management of the Hanwood coal mines, in the same locality, but as they did not turn out satisfactorily Mr. Dunsmuir shortly afterwards resigned and went prospecting on his own account. After spending some five years at this work he was at length rewarded by the discovery of the now celebrated Wellington collieries, from the judicious management of which he laid the foundation of the great wealth of which he was possessed when death put an end to his useful career. Mr. Dunsmuir was also the original promoter, as well as manager and principal owner, of the Vancouver Island Railway. At the time of his death he was engaged in opening up the valuable Union collieries in the Comox Valley, about 65 miles to the north of the Wellington mines. In connection with the above, Mr. Dunsmuir gave employment to nearly 2,000 men, and was also owner of a fleet of sailing vessels and steamships, representing many thousands of tonnage for the coal carrying business, for which his principal markets were San Francisco, Wilmington, the Sandwich Islands and China. Mr. Dunsmuir was elected to the Local Legislature for Nanaimo in 1882, and has held the seat for this constituency ever since. He was a man of great enterprise and business capacity, and combined with an iron will and indomitable determination and perseverance a most kindly and charitable disposition. His death has created a void in British Columbia which it will be very difficult to fill.

A Useful Handbook.—We have received from the Rand Drill Co., 23 Park Place, New York, a copy of their catalogue for 1889. This volume consists of some 200 pages profusely illustrated with the latest and most approved designs in drills, air compressors, air receivers, pumps and mine machinery and supplies of every description. It also contains a large amount of useful information pertaining to the drilling and excavating of ore and rock, and is well worthy of the perusal of all our readers.

LETTERS TO THE EDITOR.

Facts and Mineral Development.

The Editor

THE CANADIAN MINING REVIEW:

SIR—I feel sure that everyone who is interested in the legitimate development of our mineral wealth has read the first article in your April issue (viz., "Our Libel Suit") with much pleasure. We have long needed some independent mining organ which was strong and popular enough to make itself felt, and which would state facts without fear or favor. It is impossible to overestimate the great amount of good such an organ can accomplish if it fearlessly adopts the plan of complete independence.

The thanks of those of us who wish legitimate mining to flourish in Canada as a business and not merely as a speculative game, are due to you for the admirable stand you have taken.

I must hasten to say that so far as the matter under dispute between Mr. Lionais and yourself is concerned, namely, whether a certain property justifies certain expenditures, I know nothing whatever about it. Your warning to investors against confusing "mining locations" for "mines" is of primary importance. The term "mine" has been altogether too loosely used in this country; its definition as a place where mineral is wrought by means of artificial light is lost sight of, and even our Ontario mining law describes "a mining location" as a "mine." This we may hope will soon be rectified.

Yours, etc.,

WM. HAMILTON MERRITT.

Toronto, 15th May, 1889.

Iron in Ontario.

The Editor

THE CANADIAN MINING REVIEW:

SIR—Mr. Charles S. Burt, until lately superintendent of the Detroit Furnace Co., is now visiting the iron districts of Ontario with the view of investigating the inducements for erecting a charcoal blast furnace, and it is to be hoped that he will find a situation sufficiently favorable for the purpose.

Over 180,000 tons of Charcoal pig iron were smelted in Michigan during the year 1887, while Ontario with equally as good localities has not a single furnace in operation; so there certainly should be a good opening for this important industry.

We have plenty of ores suitable for making Charcoal iron, which are distributed over a wide area, in some instances being conveniently situated to railway or navigation, with plenty of charcoal and flux within easy distance.

The Irondale, Bancroft and Ottawa Railway, running eastward from the Haliburton branch of the Grand Trunk, passes through the Township of Snowden, in which are several deposits of ore suitable for charcoal iron. These are veins of magnetic ore close to this railway containing from 55 to 63 per cent. metallic iron with very little phosphorus and no titanium. In the same neighbourhood are also found beds of limonite or brown hematite, which would mix well with the richer magnetites.

The Largest Crane in the World—

At the Chatham dockyard there has been a test by the Admiralty of the largest and most powerful crane ever made. The weight lifted was 240 tons, and the range or radius of the crane is 75 feet 3 inches, and its height is 125 feet.

On the lines of the Central Ontario Railway and of the Kingston and Pembroke Railway are several large deposits of ore in the midst of well wooded districts, where charcoal can be obtained as cheaply as almost any place on the continent.

Situated in Lake Nipissing is Iron Island, containing a wonderfully pure red hematite, of which Professor Chapman has made an analysis showing metallic iron 65%; phosphorous, faint trace; sulphur, faintest trace; titanium, none.

Round the shores of this lake are large tracts of hardwood suitable for charcoal. North Bay, the junction of the C. P. R. with the Grand Trunk, should be a good point for a furnace, to which both charcoal and ore would have easy access.

Then on the shores of the Georgian Bay good ore is found. A mixture of magnetic and specular ore from the neighbourhood of Killarney has been analyzed by Dr. Chapman, showing metallic iron, 60.85; phosphoric acid, faint trace; sulphur, 0.04; titanium, none; silica, 7.64. This mine is close to the shore and is excellently situated for a furnace, as it is directly in the line of travel, and charcoal could be carried to it conveniently from any part of the coast. Or this ore could be shipped direct to Cleveland or other ports by water without the expense of any railway carriage.

Yours, etc.,

T. D. LEDYARD.

Toronto, May 15, 1889.

The Promotion of Mining Companies.

To the Editor:

THE CANADIAN MINING REVIEW:

OTTAWA, 18TH MAY, 1889.

SIR,—When there chances to be demand for an ore or mineral, in excess of the supply of the article, or, as the saying goes, if there is a "boom" in a metallic or non-metallic mineral, it seems in Canada to be a necessary accompaniment of the system of individual ownership of minerals, for gentlemen of large legal ability, to enter into the business of promoting mining schemes. This custom, by lawyers of legal, political and appropriative ability, has been carried on to such an extent as to be now, unfortunately, a too prominent feature in the industry, and of the failures of late years. In too many cases has this been proved, in the non-dividend paying qualities of the enterprises which they promote. Can dividends be expected when the purchase price is excessive, or beyond the actual capacity of the property, or necessary condition of ore in sight ready for stopping or mining? Mr. Lawyer promoter is interested purely in the "sell" question of the enterprise, and the "output of the mine," and "income in relation to capital," are secondary considerations to him and are relegated to the management of the company. The lawyer promoter does not hold himself responsible for excess of capital over the item of profits of working the mine. These legal gentlemen are highly protected by law from competition, in the courtly and just industry of "what is mine" by law, and the taxed account of court. So they enter the field of the mining engineer, armed with a large acreage of the so-called mining lands, more or less developed, and held in fee simple or in bond. This they desire to dispose of at very high figures, and if they succeed in doing so "according to legal principles," the manager, who usually is called in after the sale has been made, is held responsible for the success or paying qualities of this legally produced mining venture. Capital has then to appeal to the courts of justice. If the public press are found bold enough

to show up the actions of legal gentlemen, in such matters as not min(d)ing their own business, they have also to fight these lawmakers and legally capable "boomers" in actions for libel. In countries where the miners have rights, and where under good laws their rights are granted to them (such as the right to trade in their own calling or business), and where the laws allow them to exercise the at present liberal principle of "free trade" within their own province, we find the mining industry prospers. In countries where development and work are made conditions of tenure of mining claims, we find there is no chance for this legal parasitical growth. It ought to be the policy of a mining journal to protect labour engaged in, and capital invested, or about to be invested in the mining industries of the country; hence, your appropriate remarks in former numbers. Legally disposed gentlemen will have to re-write history to prove it otherwise.

Yours, etc.,

JOHN STEWART.

Amalgamation.

By B. C. Wilson, President Gold Miners' Association of Nova Scotia.

In the early days of California gold mining, amalgamation was an unknown term, and quicksilver and amalgam unknown quantities. We washed away the auriferous sands and got the golden grains in their original and yellow purity. Bye-and-bye some of the large sluicing and hydraulic companies introduced quicksilver, and it was soon in general use, but being very crudely handled immense quantities were washed away with the debris, and if quicksilver can do it, certainly the whole state of California should be thoroughly salivated.

When quartz crushing was inaugurated in Nova Scotia the quicksilver and gold were not introduced to each other until after the ore was crushed, and not during the process of reduction; consequently the present system of copper plates was unknown, but the crushed sand was washed over riffles and pools of quicksilver arranged according to the ingenuity of the experimenters in various tempting ways to inveigle the gold into a new home, and it was not considered inconsistent to employ 100 pounds of quicksilver per battery of four stamps.

I think the first person to introduce quicksilver amalgamation to crushed ores in Nova Scotia was the late Charles Puttner, of Bavaria, who came here from Carolina at the instance of the late Joseph Wier, and set up an experimental Chilian mill at Freshwater, Halifax.

If I am not in error, I started the third stamp mill in Nova Scotia, making all the patterns myself and invented, without knowing it, the present style of stamp head and method of attaching it to rod. Our venture was a joint stock affair owned in Halifax, and the directors deemed it their duty to do a great amount of detail directing on matters of which they were perfectly ignorant, and in the light of present improvements I was not much better, and I got a decided reprimand for putting in round stamps instead of square ones, and learning that I entertained certain hectical ideas of putting mercury in the mortar while the ore was being reduced they took early precaution to direct me "not to do it" under penalty of their severest displeasure.

We crushed three weeks without quicksilver, other than in riffles and in sluices; and finding particles of unamalgamated gold going off in the tailings, I then without the knowledge of any one, charged one battery with quicksilver and ran the other without. The result of the

week's work was 25 per cent more gold in the quicksilver mortar than in the other—next week I changed the quicksilver to the other mortar and ran the first without, with just about the same results in favour of the one with mercury in it. I followed this up for four weeks to thoroughly satisfy myself and then reported to the directors, who kindly directed me to use my own judgment in the matter.

This innovation called the copper plates into existence. At first they were very small and very thin; later on we got thicker ones, and made wide at the top and narrow at the bottom like the inverted gable of a house, and, so enduring are early impressions that I regret to say many persons who consider themselves authorities on this subject still adhere to this form of plate. It requires, however, but little demonstration to show the fallacy of the principle; whatever increases the quantity of water or pulp on any part of the plate disturbs the adjustment to an extent which makes either one or the other part inoperative as a saving appliance.

More recently a copper plate with an electro deposition of silver on one surface (more popularly known as "silver plate") have been introduced. My own experience with these extends over only half a year or so, but I am free to record my appreciation of them, as they always present a clean amalgamated surface from the word "go," which cannot be permanently obtained on a copper plate until there is on it an amount of amalgam equal to about two ounces of gold per square foot, which must be kept there as long as you expect the plate to be efficient, though, of course, you can get it all back when the plate has outlived its usefulness (provided the temptation offered has not induced some one to rob you of them in the meantime), while on a silver plate the permanent accumulation of gold seems to be practically inappreciable, so that, all things considered, the silver plate is both an economy and a security.

There seems to prevail an idea that any gold once attached to an amalgamated plate is practically saved. This I have lived to know, is an expensive fallacy, and one which I believe to be largely increased on the silver plate as compared with the copper one, and I deem it very important to provide means to intercept the slow glacier-like progress of amalgam which commences an almost imperceptible journey down and eventually over the plates and out of the mill.

It is an acknowledged axiom that the best thing to catch and retain gold is gold amalgam itself; and it is familiar to mill men that a plate roughly coated with beds or ridges of amalgam is the best thing to have your gold fall on as it comes from the stamps, but this is a condition of things not always possible or convenient to maintain, and, even if it were, small particles of gold, either owing to their ragged form presenting an increased surface to the flowing water, or from some other cause seeming to have less specific gravity, will keep working away from the main mass and along down the plates, aided, no doubt, by the small quantities of mercury draining from the amalgam as well as that continuously supplied from the mortars, which mercury too, always carries some fine gold with it—and together they eventually pass off the plates, resulting in very considerable loss.

Various methods are adopted in every mill to intercept these fugitives, the more familiar of which used to be:

1st. Shaking tables, which I might characterize as wolves in sheep's clothing; they have gone out of practice, however.

2nd (and what is in most general use at the present day), boxes, pools or trays containing more or less mercury as a nucleus into which the whole current is precipitated and where, it is fondly hoped, any truant particles will be induced to remain. My experience with these has been that they serve to relieve the conscience or the incompetence of the architect and the mill man, hoodwink the owner or the capitalist, and pass along to the bank of tailings, about all the gold that ever comes into them.

3rd. Riffles and blankets at the tail of the plates with facilities for catching and retaining particles of mercury, gold and the denser sulphurets. Riffles cannot be objected to if too much confidence is not placed in them. They are not human, but nearly as unreliable. Blankets are unquestionably of service, particularly if no other system of concentration is employed, and though they take a great deal of attention they undoubtedly save much valuable material for further treatment, and it is simply a question of condition of ore and capacity of mill whether it will pay to keep a man specially employed at them or not. In many mills of even small capacity I have found an official known as an "amalgamator," whose duty seems largely to be to stand and serenely listen to the hammering of the stamps, and it might in such cases be very profitable to employ blankets and let him attend to them, which besides the monetary benefits resulting, would also largely relieve the devil of finding employment for otherwise idle hands.

To prevent the loss of mercury and floating gold I believe the first principle is to afford reservoirs or deposits of mercury in connection with the plates, but under no consideration to allow such a flow or fall of the pulp as will disturb or break the surface of the mercury, and yet have these reservoirs so constructed that their shall be no accumulation of pulp or sulphurets upon the surface of the quicksilver.

There is an arrangement of the copper plate which I have found most efficient in arresting the truant particles of gold and mercury before referred to, but the arrangement is so simple that it does not generally recommend itself; also the correct adjustment lies within such narrow limits between success and failure, through impatience and neglect to investigate the cause of results, that parties are apt to "damn the arrangement" when a little more attention would have demonstrated its usefulness.

When properly adjusted it is self-acting, needing no attention, and is always in order, and consists of peculiar curved troughs formed at the lower end of each copper which allow the water and pulp to flow down the curve—not to fall—and which have sufficient elevation at the bottom to form a shallow reservoir the whole width of the plate, but with not sufficient obstacle to admit of the accumulation of sulphurets or heavy particles.

Some believe in a long sheet amalgamated plate—sometimes as long as twelve feet—my experience is, that no individual plate need, or should be, more than thirty inches long or thirty-six inches at most, that as many of these plates should be placed below each battery as circumstances or the will of the owner may consider necessary. I would suggest three as ample but there is no great danger of having too many.

As usually laid down the plates present a plain even surface from top to bottom and then perhaps a precipitate fall of one to three inches into another plate, or a series of plates. Now the plan I have mentioned locates at the bottom of each plate this peculiar curved trough which at starting may be charged with

about one pound of mercury. As work goes on the mercury is always increasing and possibly some will have to be removed before cleaning up day. Now if just the right fall and slope and rise at the foot has been obtained the down coming water will follow the curve and impinge against the quicksilver at the bottom and keep a clean mercurial surface ready to absorb all light gold or particles of mercury, and as this surface is never broken it follows that no pieces of amalgam can become detached and wash away after once attached, while the small obstruction at the foot causes the waters to curl back on itself but does not afford sufficient lodgment for sulphurets to block the current and cover the mercury, and thus derange the operation.

Now as to practical results—after a week's running on fairly good ore with the copper plates kept in good order, I have had in the first one of these troughs a ridge of amalgam from one-eighth to one quarter inch deep, an inch or so wide, and four feet long (the width of the plate) and over $1\frac{1}{2}$ pounds of mercury, all, or very nearly all of which I have reason to believe would have been lost under the ordinary process of straight plates and falls and traps.

As before stated their efficiency depends altogether in getting just the right adjustment proportionate to the fall and amount of water used, which is simply a matter of experimental testing and requiring a little patience.

Now all this applies strictly to the copper plates, after them may follow all the other devices desired but it will be found that their occupation will be gone to a large extent.

There has been and I suppose always will be, some loss of mercury through being floured and otherwise, but I am led to believe there are erroneous ideas abroad in regard to floured mercury and what it really is. Technically it is mercury divided into such minute particles that individually they are not visible to the unassisted eye. It is only when a number of them are together that they are readily visible as a white film along the edge of the palm, and I am of the opinion that the actual preventable loss from this source is very small, and the gold carried with it still less; but there is a very appreciable loss of mercury in most mills in particles or little globules readily visible, one of which will contain as much mercury as twenty or a hundred of the floured kind. These all carry more or less gold, and it is to the saving of these that the trough in the plates before described will be found particularly applicable—gravity naturally keeps them near the bottom that is next the plate, and when impinged by the current against the clean surface of mercury in the troughs a majority of them will be arrested, while if allowed to fall into boxes or receptacles of mercury, more or less covered with heavy sulphurets and with an accumulated force of water, but very few of them are retained.

In the falling of the pulp from the mortars to the plates and from one plate to another, that is the "splash," more care to have the same uniform, and occasionally the distribution changed or distributed, should be exercised than is sometimes given it. It often happens from the wearing down of a die or a shoe or some variation in drop of one stamp in a mortar that a greater quantity of water and crushed material is thrown out on one part of the plate than another, with the result that the accumulated amalgam is worn off the plate in one particular spot, even the electro-deposited silver I have seen so worn off, and the red copper showing up destitute of any amalgam or quicksilver, and my experience is that amalgam as worn off from any particular part of the plate, is more difficult

to save than new amalgam falling from the stamps. Sometimes a wire screen or perforated sheet iron is interposed in the fall from plate to plate; the flow is thus broken and the distribution accomplished; but for greater security where such are used it is desirable that they be arranged so that a slight change if only one-eighth of an inch can be made every hour.

In all the foregoing I have referred exclusively to the amalgamation and arresting of the free gold after it has been liberated from the matrix. That much gold still remains in the crushed ore in the shape of gold both mechanically and chemically combined, and which is run off and lost, is, I think, a fact patent to all. This is more a question of concentration and after treatment than of amalgamation, and is one which should engage the earnest attention of every one interested in the gold industries of the province, but in the meantime it is important to give every attention to the perfection of such processes as we have in use and to general mill treatment. Too much honest and legitimate attention by the responsible man in the mill cannot be given to his amalgamation processes, whatever their form, and to seeing that the crushing machinery is performing its duty properly and uniformly, for no irregularity can exist without affecting the whole matter of crushing, amalgamating and retaining the ore.

The Natural History of Coal.

(Contributed by Francis D. Taylor, M.E., Brockville.)

[Continued from April Issue.]

Imagine this process repeated as many times as there are coal seams in a district, and it conveys the most accurate and correct opinion that can be found of the way in which coal and coal strata was deposited.

In some coal fields there are (at least) 50 seams of greater and less thickness, all of which were produced in the way described. And the question is now forced upon the mind, how long did this vast accumulation of vegetable matter, and these siliceous and aluminous shales take to deposit?

Mr. McLaren, a Scotch geologist, who in his *Geology of Fife*, says as the result of a train of elaborate reasoning, founded upon ascertained facts. That every coal seam 3 feet thick, must have taken at least 1,000 years to form; and that the whole of the coal strata, with its many seams, must have taken between three and four millions of years to form.

The mind would be entirely baffled and confounded in connection with such periods did we not consider "That one day is with the Lord as a thousand years, and a thousand years as one day."

In order to make this matter still more clear it will be remembered that the coal strata in Wales is from 10 to 12,000 feet thick, and in the theory propounded there must have been a gradual sinking or depression of strata equal to that extent.

Mont Blanc is about 15,000 feet in height, and the gradual depression therefore of the Welch coal field must have been nearly equal to the present elevation of Mont Blanc.

There are one or two other points to refer to before quitting this part of this subject, and first, as to the kind of atmosphere that must have existed at the time of the coal formation.

It is probable that there was a much larger proportion of carbonic acid in the air than there is at present, and that as the result of this, vegetation grew at a much more rapid rate.

There is no evidence that the growth was very much more rapid than it now is, as some

have supposed, but still the effect of a larger proportion of carbonic acid in the air would doubtless be to produce a more rapid growth than we have now.

The proportion of carbonic acid in the air at present is $\frac{1}{2500}$ part of its volume, and one of the principal reasons why Providence has given foliage to trees is to enable them to collect from the air this gas which forms so important a portion of the food in which they live.

It is the opinion of many that the carboniferous era helped to absorb a large portion of the carbonic acid from the air, and by that means left it more fit for the reptile and mammaliferous developments of life that soon after came upon the stage, and that thus each succeeding geological age has helped to prepare the world to become a fit habitation for man, who is (as this world is concerned) the noblest work of God.

Second—The temperature in which most of the vegetation grew, which forms our coal deposits, must have been at least equal to our tropical climates, and could not have been less than 75° , as nearly all the plants found in the coal shales are among the class that are only found in tropical climates, where this temperature exists.

This brings out another question of great importance and difficulty, viz.: The existence of coal within the arctic circle, proving that even there the temperature was once high.

This has been accounted for by some men of eminence and science on the supposition that the plane or angle at which our planet now revolves has been altered, and instead of its revolving, as it now does at an angle of 25° , it revolved in almost an upright form. The effect of which would, of course, be to equalize the temperature all over the globe.

Astronomers inform us that is the way in which Jupiter at present revolves round the sun, so that it is not at all out of the range of probability that the opinion relative to the former position of our earth is correct.

And now to the third part of this subject, viz.: The present position of our coal beds and the changes to which they have been subjected.

This is a large and important subject, upon which there is not time to fully enlarge upon, and includes:

First—The chemical changes which coal has undergone since its deposition.

It is singularly interesting to trace the gradual chemical changes to which coal has been subjected in its various stages, from vegetable fibre to its present compact form, and it is equally interesting to know that those changes have not destroyed the chemical affinity of coal to vegetable life.

By the aid of chemical analysis we learn that the same elements may be obtained from coal as are found in vegetable life, the main difference being that they are combined in different proportions, and strange as it may seem, the diamond is composed of the same constituents that constitute nearly the whole substance of our coal, namely, carbon. Yes, the diamond is composed of the same elements as coal, and is the result of the decay and crystallization of carbon.

If burnt, it takes the same amount of oxygen as charcoal, and gives off the same volume of carbonic acid, and melts at 14° less temperature than silver.

Second—Another most important subject that comes under this head is the question of faults, or the subsequent dislocation, upheavals and depressions to which the coal strata has been subjected.

Though coal was found as described in a com-

paratively tranquil state of the world. It has been very roughly handled since then by nature.

There is hardly a coal field in the world but shows evidence of the disturbance and agitation that has taken place since its formation.

These faults sometimes throw the strata up or down for several hundred yards, and are to be found at all angles and of all sizes, proving the truth of those sublime words of one of the earliest geologists of whom we have an account. The old patriarch Uz, who said: "He putteth forth His hands upon the rock and overturneth the mountains by the roots (Job xxviii, 9)."

There are one or two laws relating to faults worth knowing:

First—That the largest and strongest faults generally run north and south.

This rule, however, is not entirely without exceptions, but it may generally be relied on.

Second—By observing the angle of the cheek or face of the fault, it is possible (nearly always) to tell whether the coal is thrown up or down, and for want of knowing this simple law thousands of pounds sterling have been lost in mining.

Third—As regards the present position of our coal seams.

It is known that coal lies at all depths from the surface, and that in some cases it is worked at the surface of the ground, like the open-top workings of the thick (or 10-yard) coal of South Staffordshire. At other places it is worked nearly 1,000 yards below the surface, as at the Dunkensfield colliery near Manchester.

During the early stages of coal mining, when the mechanical power for winding coal was limited to the hand-reel and the horse-gin, of course the operations of coal mining were of the most primitive character, and had to be carried out on the most limited scale.

At present one-half mile below the surface seems to be about our maximum limit for mining.

At present the greatest obstacle to going depths is not the lack of mechanical powers to draw the coal (we can supply that), but we want some means either mechanical or chemical of neutralizing the increased temperature of great depths. The temperature appears to increase to the extent of about 1° for every 50 or 60, or say 5° for every 100 yards. And at this rate the temperature at 500 yards deep would be 25° greater than at the surface, and in practice this is found to be the case.

Can this difficulty be got over is the question, and it is one to which our best men of science will, it is hoped, devote time, attention and thought.

That man will indeed be a benefactor of his species, who can contrive some means of lessening the temperature of deep mines.

What a blessing it is, however, that even with our present appliances so much of this useful mineral is within our reach.

Fourthly—One or two general and miscellaneous points.

First—The importance of skill in raising our coal so as not to waste what has been so benevolently and graciously provided.

A bed of coal usually produces about 1,200 tons to the acre per foot thick, but less than half that quantity is brought in some instances to the surface and sold in consequence of the waste and unnecessary loss in working it.

The introduction of the "long wall" system of working coal has benefitted the output in some cases 30 per cent. or more, and much credit is due to Mr. Moses Taylor, mining engineer, for introducing this system and adapting it to the working of the 10-yard coal in South Staffordshire.

Again the conversion of the small coal into patent fuel has done much to improve the system of working, and to economize the produce of mines. But much more has to be done yet.

Second—The adoption of wise and proper means to ensure the safety of those who are engaged in this most important branch of national industry seems naturally to grow out of what has been said.

If coal is valuable, the lives, health and happiness of those engaged in mining is more valuable still, and we are called upon by every consideration of humanity, self-interest and national honor to use every possible means to insure safety in working mines, and certain it is, that safety and economy will be found to be synonymous terms in relation to mining.

Third—The importance of a correct knowledge of the structure of the earth is suggested by this subject. Without this it is difficult to know where to look for the minerals, or metals, which are locked up in the secret recesses of nature, and which she only opens and makes known to those who have knowledge sufficient to read her language and decipher the hard writing on her rocks.

The geologist by means of carefully looking at this hard writing is able to direct the practical miner where to sink and how to act, and thus science and practice unite to promote human happiness and the material greatness of the world.

Fourth—The wonderful way in which God has arranged and adapted the earth to provide for man's wants, is suggested by the "Natural History of Coal."

Tell me what we want that the earth will not supply?

Its surface provides food of every kind, and in great abundance; fruits and flowers to please the taste and gladden the eyes.

The rocks yield our metals, and the seams of coal furnish us with fuel.

Well may the inspired "Psalmist" say: "He opens His hands and satisfies our wants."

And that heart must be cold and hard that can look upon all that God has done for the happiness of his creatures, and not exclaim, "Great and marvellous are Thy works Lord God Almighty."

Gypsum Deposits in Northern Manitoba*

J. B. TYRRELL, B. A., F. G. S.

On the Little Saskatchewan River, which carries the overflow of Lake Manitoba into the western side of Lake Winnipeg, there is a comparatively small shallow lake which has been known since the time of the early voyageurs as Lake St. Martin. It lies in latitude, $51^{\circ} 30'$, longitude, $98^{\circ} 46'$, has an area of 115 square miles, a greatest depth of about fifteen feet, and an approximate elevation above the sea of 790 feet.

Lying to the north-west of this lake, there is an area of level or very gently sloping country, which is now covered by extensive natural meadows, separated by groves of poplar and birch, as well as occasional forests of spruce and tamarac. This country is as yet in its native beauty, being entirely untouched, either by the woodman's axe or the plough of the farmer; but the time cannot be far distant when a thriving agricultural population will occupy the district, reaping from the fertile soil bountiful and continuous harvests.

In the early part of the past summer, the writer made a short journey on foot into this country, from the shore of the lake, in order to determine the question of the existence or non-existence of beds of gypsum in the vicinity.

Starting from the north-west corner of the Indian Reserve at present held by the Saskatchewan Band of Saulteaux Indians, we travelled in a general north-westerly direction for five miles, till we reached a rounded gravel ridge, rising from fifteen to twenty feet above the general level of the country to the northwest of it, and along the foot of which, on the alluvial plain, are scattered numbers of rounded, weather-worn, gneissoid erratics. This ridge represents a beach of the extended Lake Winnipeg, called by Mr. Warren Upham, Lake Agassiz, when it covered the whole of this area, and when the surrounding fertile alluvial deposits were being laid down near its gradually receding shore. The height of this ridge, as shown by aneroids read simultaneously on it and on the lake, is about 840 feet, being fifty feet above Lake St. Martin, and thirty feet above Lake Manitoba. Its chief interest, however, did not centre in the fact that it had once represented a lake shore line, for these shore-lines are very commonly to be met with in all this apparently level Manitoba plain, but that in little holes and caves in it were to be seen small exposures of soft, compact, snow-white gypsum.

Following the ridge, still in a north-westerly direction, for a mile, the surface becomes very rugged and irregular, being broken by deep pits with steeply sloping sides. In this rough country, gypsum may be seen in numerous outcrops, being usually soft and crumbling from the effect of weathering, but in some cases it is still quite hard. The height of the tops of the knolls in this hilly area is about thirty-five feet above the eastern level plain, or sixty feet above Lake St. Martin. The breadth of the hilly country was not determined, but an Indian who accompanied us stated that it extended in a south-westerly direction as far as a certain point on our journey of that day, which was about a mile and a half distant from where we were then standing, beyond which the level country began again.

In a north-westerly direction the ridge was followed for two miles further, to a rather conspicuous hill a short distance north of the Ninth Base Line in section 2, township 33, range 9, west of the Principal Meridian. In this distance it appeared to be broken through by considerable gaps in several places, but where it was well marked it invariably showed the irregular surface so characteristic of country underlain by gypsum deposits. In many places, small caves would extend in from the bottoms or sides of the pits, some of which held beautifully clear, cold water, a luxury of which we were able to appreciate the value, after tramping for the greater part of a sweltering July day through meadows, forests and swamps, where the mosquitoes and black flies did not attempt to treat us any the more tenderly because we were strangers.

This country is a famous winter hunting-ground for the Indians, for in the autumn the bears retire to these caves, as being comfortable quarters in which to pass the time until the following spring, and many of them are killed every year. Around the mouths of several of the caves could be seen marks of the axe, where the hunter had been obliged to widen the entrances to the caves to be able to get into it to secure his prey. The thickness of the exposures of gypsum in these holes and caves was nowhere very great, ranging as a rule from three

feet to six feet six inches, but in none of them was the total thickness of the deposit seen.

The hill at the furthest point to which the ridge was followed, rises as a rounded knob, twenty feet above its general level. This hill, like the others, appears to be composed of gypsum, as on its sides are holes extending down twenty feet below its top in which beds of gypsum are well exposed.

In the north-west corner of township 32, range 8, west of the Principal Meridian, is a rounded hill rising thirty-five feet above the plain, its greatest length being about 600 feet, and its greatest breadth 150 feet. Its surface is overgrown with small canoe-birch. Two holes, each about eight feet deep, have been dug by prospectors in this hill. One at the top shows, below a foot of decomposed material, seven feet of hard, compact, white anhydrite or "bull plaster," exhibiting a more or less nodular structure, and breaking on the surface into small irregular fragments. Very little bedding can be detected in the mass. The other hole is in the side of the hill fifteen feet lower down, and shows on top two and a half feet of white clay, consisting of decomposed anhydrite, below which is five and a half feet of white nodular anhydrite similar to that in the other hole. This gives a thickness, almost certainly, of twenty-two feet of this rock, and it is not improbable that the hill is composed entirely of it.

Again, just north of the Ninth Base Line, and two miles east of the township corner, between Ranges 8 and 9, is a poplar-covered hill or ridge, thirty feet high. In various places on this hill are exposures of snow-white gypsum, similar to what has been described above, showing in some cases a thickness of ten feet in one section. The most of it is massive or cryptocrystalline, and lies in regular beds which dip slightly towards the west. Some of the beds or layers, however, consist of beautifully crystalline, clear, colourless selenite, which is easily broken out in lamellar masses of considerable size. This is the mineral which in the west, has been so often mistaken for mica.

The above is a brief statement of the known extent of the deposits of gypsum in this district, but it is highly probable that further investigation will prove them to extend over a much larger area. The Indians of the Saskatchewan Band, who live on the western shore of Lake St. Martin, informed me that similar rock was to be found in several places further north, and they have named a lake on a tributary of Warpath River, which flows into Lake Winnipeg north of the mouth of the Little Saskatchewan, Ka-ka-wusk Sa-ka-higan (translated in English as Mica Lake) from the alleged presence of selenite in its vicinity.

Towards the south-west, at a distance of 90 miles in a straight line, in the bore that was sunk on the bank of Vermilion River by the Manitoba Oil Company, a bed of gypsum 15 feet in thickness was struck between 550 and 565 feet, at approximately the same geological horizon as that of the gypsum beds above described. Gypsum deposits are therefore in all probability very widely distributed throughout Northern Manitoba.

As far as examined they preserve a pretty constant character. Where they immediately underlie the surface the country is very rough and hilly, and the prevailing poplar of the region is mixed with birch, or the spruce of the adjoining low-lying land is replaced by Banksian pine. The gypsum itself is generally very pure, of a dead white color, and usually stratified in rather thin beds, which are either horizontal or dipping at a low angle. Among the massive beds, however, are many others, com-

posed of crystals or crystal-masses, in which the crystals usually stand transverse to the plains of bedding. Some plates could doubtless be obtained from the crystal-masses sufficiently clear for optical purposes. No anhydrite was seen mixed with the gypsum, but one of the hills, as above stated, appeared to be composed entirely of it. It is much harder and tougher than the gypsum or hydrated sulphate of lime, is considerably heavier, has a roughly nodular, rather than a distinctly stratified structure, and is of a decidedly bluish tint.

Of the exact geological age of the deposit it is difficult to speak as yet with certainty, as the strata have not been continuously traced into any others, and no beds immediately under or overlying them have been seen. There is little doubt, however, that they occupy either the summit of the Silurian or the base of the Devonian limestones. All the evidence that we have on the point has not as yet been perfectly elaborated, but it consists in the general horizontality of the beds wherever seen throughout the whole area, and in the existence of limestones holding fossils on Lake Manitoba, twelve miles distant in a south-westerly direction, and of limestones holding fossils on Lake St. Martin, eleven miles distant in a south-easterly direction. Also reference might be made to the above mentioned bore on Vermilion River, where the gypsum was at the base of a bed of Devonian limestone 130 feet in thickness. Thus these deposits are practically of about the age of the Onondaga Formation of New York and Western Ontario, in which rocks plaster-quarries have been worked for many years. This formation also contains the great salt deposits of Ontario, and it is a significant fact, that a short distance to the west of the area under consideration, around the shores of Lakes Manitoba and Winnipegosis, many brine springs are known to occur. In the State of Michigan, many of the plaster-quarries are also in rocks of about the same age. In Nova Scotia, the gypsum deposits are of lower Carboniferous age, and in Iowa they are stated to belong to a still higher horizon.

The general hilly and irregular character of the surface underlain by the plaster beds, and the fact that isolated hills of gypsum rise above the surface of the otherwise level plain, make it appear probable that the deposits occur as lenticular masses in the beds of limestone which seem to compose the general floor of this whole area, though in most places the limestone is covered either by a mass of glacial till, or by the alluvial deposits laid down on the bottom of the ancient Lake Agassiz. The gypsum also resembles the limestone in being clearly stratified horizontally or at a very low angle. Besides this, some of the limestone of Northern Manitoba contains a large amount of sulphur scattered throughout its mass in the form of minute grains of iron pyrites. The iron pyrites readily oxidises into a sulphate or double sulphate of iron which combining with the carbonate of lime give as products of the double decomposition, sulphate of lime or gypsum, and carbonate or possibly sulphate of iron. In the Cretaceous shales of the Duck and Riding Mountains and of the Plains further west, this process is clearly seen to have gone on. Iron pyrites is constantly present, and the shells of Inocerami, Ammonites, Baculites, etc., furnish an abundant supply of carbonate of lime. This shale is therefore often filled with minute, or sometimes even large crystals of gypsum, and side by side with them are masses of ironstone or impure carbonate of iron, which, after being formed in the above described way, has collected in rounded or lenticular nodules about a shell,

fragment of a crayfish, or other nucleus. In the case of the Paleozoic limestones, however, no trace is found of the carbonate or other salt of iron which would have resulted from the double decomposition, and if it was ever formed in the rock, it has since been dissolved away by water percolating through the strata.

The gypsum may, however, have been formed in a different way. The whole of this country has undoubtedly suffered very considerable erosion since Cretaceous times, the shales and marls of the Duck and Riding Mountains having almost certainly extended much further east than Lake St. Martin. Many of the springs that now flow from these shales are strongly impregnated with sulphuretted hydrogen, which might readily be oxidized into sulphuric acid. This acid acting slowly on the beds of limestone would alter them into sulphate of lime without disturbing the stratification at all.

Of the uses of gypsum it is unnecessary to speak. In the Western States, where the air is dry and atmospheric erosion is very small, it is used as a building stone, being very easily worked, and sufficiently durable and strong for residences and all ordinary buildings.

By roasting, its water of crystallization is driven off and it is reduced to the fine powder commonly known as Plaster of Paris. By grinding the crude gypsum as it comes from the quarries between ordinary burr stones, land-plaster is obtained, a substance of which it is difficult to overestimate the value in a country whose resources are almost entirely agricultural. The soil of Manitoba and the North-West Territories is very fertile now, but a time will come when having raised crop after crop it will need replenishing. The value of this extensive gypsum deposit will then be thoroughly realized. Lying as it does within twelve miles of Lake Manitoba, a navigable stretch of open water extending southward almost to the Manitoba and North-Western Railway, it can readily be brought to all parts of the province. It is also on the line of the projected railway from Winnipeg, between Lakes Winnipeg and Manitoba, to Hudson's Bay, and by this railway would be within one hundred and fifty miles from Winnipeg, and as the intervening country is very level, the cost of carrying it there would not be great.

The Ormerod Safety Cage.—At a recent meeting of the Wigan Mining and Mechanical School, Mr. Edward Ormerod, of Atherton, exhibited and explained to the students his patent safety cage. It is well known that safety hooks and over-winding gear, however perfect, will not deal with the accidents arising from the breakage of a winding rope, in which case the liberated cage rushes headlong to the bottom of the pit, and the occupants, if any, are almost inevitably killed. Even if there are no persons in the cage, very much havoc and destruction of property results. The object of all safety cages is to prevent a cage falling when the rope breaks; the cage grips the conductors and remains firmly and safely suspended. Many safety cages have been introduced, but are chiefly applicable to wood conductors, and do not answer at all for wire conductors. Mr. Ormerod has endeavoured to invent a safety cage which shall be applicable to conductors of any kind, either wood, iron or wire. The experiments made with the model were all completely successful and were witnessed with very much interest by Mr. C. M. Percy M.E., F.G.S., and Mr. R. Betley, F.G.S., and a large number of students. Mr. Ormerod will undertake to fix his safety appliance to any cage or hoist, and if satisfaction is not given will re-

move the appliance free of cost. Not only is the safety cage a means of dealing with accidents by breakage of rope, but it also operates very effectively in supplementing the action of the safety hook in case of an overwind. There have been cases in which the momentum of the cage in falling back after detachment has shattered the safety hook, and the cage has not been held; but with this safety cage there is practically no falling back, because immediately the cage commences to return after detachment the safety appliance comes into operation and holds the cage. The invention is well worth the attention of our colliery managers and colliery proprietors, anxious as they ever are to adopt all appliances which can lessen the number of accidents in connection with collieries.

Shipments.

The following have been the Shipments of Canadian phosphate since opening of navigation to 15th May, from Montreal to Europe:

Date.	Name of Vessel.	Destination.	Shippers.	Quantity.
Apr. 30.	S.S. Lake Nepigon	Liverpool	Lomer, Rohr & Co.	240
May 13.	" Toronto	"	Aglo Can. Phos Co.	350
" 15.	" Lake Winnipeg	"	Lomer, Rohr & Co.	95
" 15.	" Loch Lomond	London	"	567
Total				1252

RECAPITULATION.

Lomer, Rohr & Co. 902
Anglo-Can. Phos. Co. 350

Total 1252 Tons.

At time of writing the following vessels are being loaded: S. S. Oxenholm, by Wilson & Green; S. S. Tremona, by Millar & Co.; S. S. Castellano, Alcides and Montreal, by Messrs. Lomer Rohr & Co.

Mr. T. W. Hotchkiss, American Consul, furnishes us with the following values of the exports of ground phosphate to points in the United States from Ottawa Valley mines:—January, to Chicago, \$1,000; February, to Chicago \$1,000; Buffalo \$519.50; March, to Buffalo \$700; April, to Detroit \$1,349.85.

Kingston District.

The Foxton Phosphate Mining Company was registered in London, Eng., on the 18th ulto., with a capital of £12,000 in £1 shares to acquire and work the phosphate mine formerly owned by Mr. James Foxton, Sydenham. No prospectus was issued to the public, the money being subscribed by a few capitalists. Mr. John Higginson, formerly of the North Star Mines, has been engaged as Superintendent. The work is progressing satisfactorily at the pits, but until everything is well organized no large output is looked for.

Du Lievre.

The shipping of phosphate on the river is now in full swing, and the aggregate quantity daily loaded into cars and coming from the High Rock, Dominion, Emerald and Canadian Co.'s mines average some 250 tons. The ore from the Central lake mine will swell this output; we understand that the first shipments of it are to be made at once.

Prospectors for phosphate properties are very active in this locality, but few of the many operations on foot for the acquisition of phosphate properties appear to materialise.

The Prospectus of the Emerald, Central Lake and Lievre District Phosphate Company will be issued next week.

Mr. O. M. Harris, of the Canadian Phosphate Co., reports that work is proceeding satisfactorily at the mines; about 500 tons have been shipped since opening of navigation.

A small force is doing development work at the Little Rapids mines. A number of very promising shows have been opened on Lot 7, adjacent to mine. Both of these properties have recently been visited by American capitalists, it is said, with a view to purchase

Templeton District.

The Jackson Rae Company has gone to allotment. The capital is \$25,000, in £1 shares, of which 13,000 are offered to the public.

In General.

In his recent Report the Minister of Agriculture cites the following instance of the utility of ground phosphate as a fertilizing agent: "I am creditably informed that an experiment was made during the past year with crude phosphate which had been ground to an almost impalpable powder on a field of potatoes in this district, half of it being treated with this fertilizer, and the other half with ordinary farm yard manure. The result was that the part of the field where the phosphate had been used yielded much larger and cleaner tubers than the other half, the soil in both cases being exactly the same."

A prominent German importer has recently visited the Lievre phosphate region with the object of arranging for larger consignments of Canadian rock to be sent direct to his factory at Hamburg. This gentleman wishes to avoid the brokerage and other charges incidental to the present system of shipment.

Mr. Thomas Macfarlane, F.R.C.S., Dominion Analyst, again calls attention to the large amount of money which farmers pay for the ammonia in fertilizers which might be saved if sufficient care was taken to preserve that contained in barn-yard manure. Nearly the whole of the nitrogen in the fodder fed to farm stock is to be found in the excrements of the animals, and one-half of it is contained in the urine. It is further the fact that 95 per cent. of the potash contained in the food of oxen and sheep may be recovered by carefully saving the liquid manure only. To secure the nitrogen or ammonia and the potash, the means are very simple. The dung from the different animals should be brought together, and kept under cover at a lower level than the stable floor, so that the liquid manure may flow upon, over and down through it. In this way all the different sorts and both parts of the manure are properly blended, the solid part and the bedding kept moist and none of the urine escapes. It is further necessary to strew the stable floor, below and behind the animals, with 2 lbs. per 1,000 lbs. live weight, daily, of ground plaster or sulphate of lime, which has the effect of retaining the ammonia resulting from the decomposition of the liquid, and the fermentation of the solid manure. It has recently been proposed to obtain these results by the use of superphosphate, in place of ground plaster, and experiments by Heiden, Dietzell and others in this direction have been entirely successful. Dietzell mentions that 1½ lbs. of phosphoric acid only are required for the treatment of 1000 lbs. of stable manure. The use of "plain

superphosphate" in this way must result in the production of a manure of every excellent quality.

Market.

Messrs. Couper, Millar & Company, London, send us the following report of the Fertilizer market of the United Kingdom :—

About this time last year we had to report that Ammonical materials were "booming" and Phosphates depressed. The position for this year is for the moment reversed, principally through the recent fluctuations in the Nitrate, market. The scarcity of organic Ammonia however, must before long effect an upward influence in prices for this class of material, while phosphates of every description, but in particular, those of high test, are likely to touch much higher prices owing to the unprecedented lowness of stocks and the comparatively small quantity available at the moment.

MINERAL PHOSPHATES.—Canadian 80 per cent. has been sold at 1/0½d. with 1-5d. rise English terms, while 10½d. and 11½d. are asked for 70 and 75 per cent. qualities respectively. South Carolina has been sold lately at 9½d., and there are numerous enquiries from both home and continental buyers, but this figure does not tempt shippers the United States demand being very active. Somme has been largely dealt in this year, and the prices of all qualities are very materially increased as the end of the supply of the higher grades is within measurable distance. Belgian must advance in harmony with other phosphates, but, at the moment it is cheap and therefore well worth attention. Cambridge coprolites offer in such small lots as to be hardly worth mentioning, but business has been down lately at 45 shillings f. o. r. Bedfords are not offering.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

NOTICE.

At the Annual Meeting of the Gold Miners' Association of Nova Scotia, held at Halifax, on 6th March, a resolution was passed adopting the "Canadian Mining Review" as the official organ of this Association. Our readers may therefore rely upon the accuracy of all information published in these columns bearing on the gold mining industry of the Province.

Nova Scotia.

Lake Catcha District.

The Oxford Gold Mining Co. has just completed a trench about 400 feet long, and drained off the body of water known as Lake Catcha. This throws open and makes prospecting possible on some 16 areas heretofore nothing but swamp. While little is known of the lake bed, good drift has been found indicating valuable lodes in the swamp. Vigorous prospecting has been started and will be continued all season. The mill is crushing on good pay ore.

Malega Lake District.

Considerable activity is displayed in this district, a great deal of prospecting being done with very satisfactory results.

The Parker Douglas Co. are raising good ore from their old workings, and have also opened up a new lode, which is promising. We understand that the owners are very well satisfied

with results and with the general outlook. At present the output of gold is limited, as they have but five stamps in their mill; but this plant will probably soon be enlarged, as they have a body of ore which apparently would warrant the erection of a twenty stamp mill.

The Caledonia Mining Co. are erecting a building for hoisting plant, and the machinery for it has been shipped; an air compressor and drills will be put in also. A contract for sinking a shaft 100 feet has been let.

The Malega Mining Co. are working three lodes, but owing to the recent fire, in which the pumping and hoisting plant of two of them was destroyed, the output of ore has been so curtailed that the twenty stamp mill has been run only on half time. The three lodes from which ore is now being taken are the "Chester," "Rabbit," and "Nine Boulder." The "Chester" is a twelve inch lode yielding one ounce of gold per ton, and which is opened down to a depth of 200 feet; not much ore is being raised here, as it is the purpose of the management to sink and drive. The "Rabbit" lode is thirteen inches thick, yielding by the regular mill run two ounces per ton, and in places is much richer. One ton of ore taken down a short time ago was estimated to contain one hundred and fourteen ounces of gold. The "Nine Boulder" is the largest lode discovered on the property, running from 36 to 43 inches in thickness. It is heavily charged with sulphurets, and yields about fifteen dwt. of gold per ton. This lode being the greatest ore producer of the property, reduces the average yield to one ounce five dwt. per ton from the three lodes combined.

A shaft is now sinking and some drifting being done on the "Nugget" lode, but no ore has been taken down. This lode, though not large, is rich. A piece weighing 200 pounds slid off a short time ago and was broken up. From it 30 pounds of ore was selected which was mortared by hand, yielding 25 ounces of gold.

Tributers are working a five inch lode with satisfactory results, their first crushing having yielded at the rate of one ounce per ton. The company is doing a great deal of prospecting, and new lodes are being opened.

North Brookfield District.

The Philadelphia Mining Company are erecting a steam pumping and hoisting plant. Their last "clean up" gave them 265 ounces. Considerable prospecting is doing in the district.

Westfield District.

The machinery for the plant at the "Jumbo" is on the ground, and work on the mill being crowded. The lode in one place is over 80 feet thick, and it is the intention of the owners to have their plant equipped with all modern appliances for saving both the free and the combined gold.

New discoveries west of this district are attracting considerable attention.

Whiteburn District.

The McGuire mine continues its regular output of gold, and was the largest producer in the province last year, excepting only the Dufferin mine at Salmon River. The Graves' mill has started up again with new facilities for hoisting and pumping.

Gold River District.

The Neptune Gold Mining Co., under the management of C. E. Willis, has been actively engaged during the winter and spring in developing the property purchased by them in December. The company have erected hoisting works, and other necessary buildings, and have a fine ten stamp mill about ready to run.

Two other lodes are being worked in open cuts from the foot of a steep hill, and about one hundred and fifty tons of ore will be taken from each as a test. The company is cross-cutting its property and has opened several lodes on which test shafts will be sunk during the summer.

Mr. McMillan is opening up the property belonging to Messrs. Fulton, Foster & Gammon, and is taking out some very good ore from an eighteen inch lode, on which the shaft is now down forty-five feet. He will shortly start sinking on a five foot lode which has indications of being a good one, and will cross-cut the one hundred foot belt, in which there are some sixty feet of quartz. Should these large lodes prove remunerative, a fifty stamp mill will be required to handle the ore.

Mr. John McGuire has started men prospecting on his claims, and several other owners are about ready to begin, and a large amount of development work will be done during the summer.

The main shaft on the "captain" lode is now down one hundred feet, and drifts have been driven east sixty-eight feet, and west seventy-six feet on the vein. The shaft is now being sunk to the two hundred foot level and will be finished before stoping is begun. The lode, which was eight inches thick where first opened in the shaft, has increased to about two feet at the one hundred foot level, and seems to be increasing in richness as well as in size, as sinking continues. The best ore yet encountered has been taken out between eighty-five and one hundred feet in depth.

Miscellaneous.

At the Pictou County Collieries the prospects of work during the summer are far from encouraging, for at most of the mines, up to the middle of the month, large numbers of men were idle, while those that are employed have much idle time.

At the Acadia colliery the depression is still felt and although no men have been thrown out of employment entirely there has been a good deal of broken time. The sinking of the new lift at this place is being steadily pushed forward.

At the Black Diamond, however, there seems to be a steady demand for the whole of the output, and the only lost time has been caused by some necessary repairs. Work at the Drift to prove the underlying seam has for the present been suspended.

At the Albion mines the Acadia Company is still engaged, at enormous expense, in the re-opening of their mines. The re-opening of the Foord pit is by the utmost care and perseverance being successfully carried on despite the great difficulties that are met with. The sinking of the English slope to the famous Cage pit seam and the reopening of the other slopes still continues. The hydraulic pump failed to give satisfac-

tion, and is now being replaced with a steam one. As at the other collieries, trade is very depressed.

Work is somewhat brisker at the Vale Colliery, and probably this fact has led to another influx of Belgian miners.

In this vicinity a small pit has been opened by a Mr. McNeil, of New Glasgow, but operations at present are suspended.

The Colchester Coal Mining Company purpose commencing operations on their property at Coal Brook early in June.

At the Drummond Collieries the state of trade is such as not to warrant the re-opening of the Scott Pit and No. 4 Slope, consequently men are yet out of employment who have been looking hopefully forward to the resumption of work at these places.

The Cumberland Coal Company, of Springhill, N.S., has bonded a quantity of coal land on Queen Charlotte Island, in the Pacific. On the property there is already a 400 feet tunnel run by a former company. The Nova Scotia company will run the tunnel 400 feet further, and then sink a shaft. It is their intention to institute a thorough search for coal.

Mr. R. G. Leckie late managing director of the Springhill Mines, is negotiating for the purchase of the Joggins Mines in Cumberland County, N.S., which with the Joggins Railway and the neighboring Prospect Mine, are mainly owned in St. John. The price suggested for the principal mine is \$200,000, and for the Prospect Mine \$40,000, while the offer said to have been made for the railway is \$140,000. The railway is twelve miles long.

Mr. W. Hall, manager at Springhill has asked the men to double up in the East and North slopes for a short time, as he is unable to keep the West slope running on account of the quality of the coal.

At Little Glace Bay, banking is about to start for the second time here. It's reported that they will bank 5,000 tons this time, which will make a bank of 15,000 tons with what is already stocked.

The first steamer arrived at the Intercolonial Company's wharf on the 18th instant to load coal for Montreal; it is understood that this is the only boat chartered as yet by this company for the season.

A discovery of coal is reported on land adjoining the Acadia and Black Diamond areas, but up to time of writing no particulars have been obtained. It is understood that these areas have been leased.

Notice is given that a meeting of the Lake View Mining Company (Limited) will be held at Newark, New Jersey, on 8th June, for the purpose of organizing and transacting other business.

Prospecting at Five Islands has been stopped for the present. There has been 500 feet of drifting done, and a shaft sunk 56 feet. Four small seams of coal have been gone through.

The main shaft of the Eastern Development Company, Cape Breton, is down to the third level, 244 feet; one larger stringer of ore had passed out of the slope to the north, and another was just coming in in the bottom. These stringers are part of vein C, which will be cut from this level. Vein B will not be cross-cut to until the next level is reached. Connection between the first and second levels in vein B has been completed by the up slope from the second level; the vein holds in width and quality of ore. The west drift of the second level is now coming in with rich purple and yellow ore. Letters from the mining captain in charge state: "It is the best showing yet made in this rich vein." South cross-cut into the mountain has entered a change of rock, and cut stringers dipping to the north same as the other veins, but nearer perpendicular. It is expected to soon cut vein E at this point. Five ladders and buckets have been provided for all the surface buildings, and the force organized into a fire brigade. The company has received official assurances from Ottawa that the Dominion Government will furnish the rails for the proposed railroad from the mine to Sydney Harbor. Reports from Messrs. Humboldt & Co., of Kalk, Germany, on the treatment of the low-grade ores sent them, show that the 2.25 per cent ore was concentrated up to 9.50 per cent., and the 3.46 per cent. was carried to 12.61 per cent, showing conclusively that the low grades can be handled to advantage.

New Brunswick.

A party of professional and business gentlemen have arranged to visit one of the many coal mines in Queen's County with a view of taking stock therein and pushing the development. It is said that Mr. John Byers, who for many years was the manager of the Albertite mines, and Major Markham are to be of the party.

The Pope Manganese Company have commenced operations at the Markhamville mines, with Mr. W. C. Pope as manager in United States and Major Markham at the mines.

The Philamaroo gold and silver mine is in active operation. Capt. Alley, of Bar Harbor, was in Sussex this week looking after its interests, and also that of his manganese mine on the Glebe in Waterford, where he has a few men prospecting.

Quebec.

An English correspondent informs us that the Asbestos quarry at Coleraine owned by Messrs. Fenwick & Slater, Montreal, has been sold, but at time of writing no particulars have been obtained.

The Anglo-Canadian Asbestos Company have uncovered some large veins in a new pit, and these are said to be yielding stuff of excellent quality.

We have no special information from any of the other mines, operations are, however, going ahead briskly, and things are getting into good shape for the season.

We are informed that nothing has been accomplished by Major Evan's English people with the Ross-Ward mine, and that the matter is now off. Mr. T. H. Carman, Winnipeg, states that he has now obtained an option on the property and that he is negotiating with a strong English syndicate for its sale.

Messrs. M. Beatty & Son, Welland, have shipped a new hoisting engine, boiler and derrick to the Frechette mine at Thetford. It is intended to do a larger business than heretofore at these pits.

Mr. S. P. Franchot, Buckingham, has shipped from Montreal, through Messrs. Lomer, Rohr & Co, 165 tons of feldspar from the Villeneuve mica mine.

Mr. W. H. Dickson, has uncovered a very promising show on his Buckingham plumbago

Ontario.

Port Arthur District.

Notwithstanding the recent constant heavy rains and bad roads, travel into and traffic to and from the silver mining region is steadily increasing. Several heavy New York capitalists are now here in the interests of the railway, and the result of the conference of the combined companies is almost certain to result in a rapid rush of the work for the first fifty miles at least. The shipping of ore from the present rich workings on Silver Mountain East resembles towing in mud scows.

There is nothing unusual to report concerning the various standard mines. Silver Mountain West keeps on developing very richly, and the Badger, Beaver and Elgin are all turning out rich ore. The Beaver is preparing for a steady output to the mill, which will shortly be working.

Docks are being built for the accommodation of the Silver Fox, Wolverine and Queen mines north of Whitefish Lake. It is rumoured that the Palisade and Medicine Bluff veins will shortly be put under development by Eastern capital.

Now that the Minnesota iron lands are so difficult to obtain there is a great rush after iron in various localities in the district. Applications are pouring in for lands for iron extending from Rainy Lake in the west to Nipigon Lake in the east. The taking up of iron lands promises to be one of the large sources of revenue to the province.

The Board of Trade at Port Arthur has had a fine set of cabinets prepared, and is receiving splendid collections from the various mines for exhibition.

The West Beaver mine, as reported, has been successfully floated in England, and the prosecution of work will likely take place at once. This property is most favorably situated, adjacent to the road, railway, and some of the chief producing mines.

The "West End Company" is the name of the new organization which is seeking incorporation, and will operate the famous west end of Silver Mountain on an extensive scale, commensurate with the results anticipated.

Several interests in the Silver Mountain region have recently changed hands at figures realizing handsome profits to the settlers.

Manitoba and North-West Territories.

Notice of application has been made by James Baylis, Montreal, John Lamb, Toronto, Samuel Mathewson Baylis, Montreal, Joseph James Tolfree, Toronto, George Samuel Wait, Montreal, for letters patent to incorporate them under the name of "The Stair Coal Mine and Manufacturing Company."

The purposes for which such incorporation is sought are: 1. The purchase and sale of coal, mineral and other lands near Stair in the District of Assiniboia, in the Northwest Territories and especially in Township thirteen, Range six, west of the fourth principal meridian; and the working of said mines, the quarrying of stone, the manufacturing of bricks and iron, the purchase, erection and operation of flour mills, and the transportation and sale of the products thereof; the purchase, construction, maintenance and operation of all works for, and the employment of all suitable means of, transportation of the products of the same whether by land or by water. 2. Carrying on a general mercantile business in connection therewith. 3. Acting as financial agents, receiving money on deposit and lending money at interest. 4. The construction and operation of telegraph and telephone lines in connection with said mines and works. The chief place of business of the company will be in Montreal, in the Province of Quebec.

It is understood that the Canadian Pacific Railroad Company has agreed with the Government to build a branch line from Brandon southwest 100 miles to the Souris coal district, and also an extension of 25 miles from the present terminus of the Manitoba & Southwestern Railway to a junction with the projected Souris branch above mentioned. The condition which the company undertakes the construction of these lines is the usual grant of 6,400 acres to the mile.—*E. & M. Journal.*

British Columbia.

The Irondale Iron Works, Port Townsend, which have been two years in operation, have increased their capital, and are going to erect rolling mills for the manufacture of steel and wrought iron, in addition to their present output of first-class pig iron, which is much in demand at the Union Iron Works, San Francisco. Their facilities for shipping and transshipping are good. Their magnetic iron ore from their mines located on the Southwest coast of Tuxedo Island, B. C., is of excellent quality. The ore is simply quarried out of a high bluff of iron ore close to the shore; 25 men are employed daily the year round. It is conveyed by steamer to Irondale, Port Townsend, W. T., and mixed with some iron ore found near Irondale, of a limonite character. Lime is shipped from San Juan Island for fluxing, and at little cost of transportation. The company are now employing 400 men or more in mining, making charcoal, and smelting, and it is reported that about 40 tons daily of pig iron is produced. The capital is \$1,000,000, and head office at San Francisco, California.

Twelve months ago a search for coal was made near Comox by the Union Mining Co. Two slopes have been driven 1500 feet and a seam $4\frac{1}{2}$ feet thick of superior coal is now being worked. Eleven miles of railway have been also built to Hart's Point; two locomotives have arrived and 60 coal cars are in course of construction. New hoisting machinery have been put down at the mines and everything is being pushed forward for an early shipment of coal. About 8,000 tons have been banked and await the completion of cars for shipment.

At the meeting of the new Vancouver Coal Mining & Land Company, Mr. Galsworthy, who presided, said 181,470 shares in the new company had been applied for and allotted, and

very few shares were left. The company was now in position to dispose of its property to the executors of Messrs. Rosenfeldt. The output of the mines this year has been better than it has ever been. An interim dividend of $2\frac{1}{2}$ per cent. was declared.

The workmen employed in sinking the No. 6 shaft of the Wellington Collieries, succeeded in reaching the coal on Friday afternoon, and have now got through the seam, which shows excellent coal eight feet thick. The No. 6 shaft is situated down the Mill stream valley, in the direction of the East Wellington Colliery property, and conclusively proves the large area of the coal property of Messrs. Duusmuir & Sons.

The Pacific Bullion Mining Co. has been registered at Victoria under the Companies Act. The object for which this company is formed is for the mining, milling, smelting and working of ores and minerals contained in the mines known as the Spokane and Trinket, situated in the West Kootenai Mining district, formerly known as the Warm Spring Mining district near Kootenai Lake, British Columbia, and such other mines as the company may hereafter acquire. The amount of capital stock is one million dollars, divided into one million shares of the par value of one dollar each, and said stock to be unassessable. The place of business of the company is at Nelson Warm Springs, Lower Kootenai Mining district, British Columbia.

The Crow's Nest Coal and Mineral Company Limited is applying for a certificate of incorporation. The company is formed for the purpose of acquiring and selling coal and mineral lands in the Province of British Columbia, and working the same in a miner-like manner, and extracting the coal and mineral therefrom, and selling the said coal and mineral extracted therefrom, and for erecting and using all the buildings, machinery and plant, railways, tramways and roadways necessary for working and winning coal and mineral from the said lands in an efficient and workmanlike manner, and transporting the same to place of shipment, and for the purpose of erecting all the necessary buildings, machinery and appliances therefor, and for the purpose of building or purchasing steamships or other vessels to carry and convey the said coals, coal oil and materials, and articles of merchandise from the place of shipment to whatever place may be desired by the company, and generally to use the said vessels and steamships in connection with the business of the said company. The amount of the capital stock of the company is two million dollars, divided into twenty thousand shares of one hundred dollars each. Five trustees shall manage the concerns of the company for the first three months, viz.: Lieutenant-Colonel James Baker, Joseph Despard Pemberton, William Ferne, Peter Creak Fernie and Edward Bray. The principal place of business of the said company shall be at the City of Victoria, in the Province of British Columbia.

Improved Ore Stamps.—An improvement has been invented by Messrs. C. E. Appleby and G. E. Abrahams, London, Eng., the object of which is to increase the power and efficiency of the ordinary ore stamps, which are raised by a series of cams upon a revolving shaft, and are then allowed to fall upon the ore or other material to be pulverized. According to the arrangement which has hitherto

been general, the stamps depend for gravity alone for their pulverizing force, but the inventors have determined to employ additional mechanism for assisting the stamps in their downward course. For this purpose a piston is fitted by a universal joint to the upper end of the stamp, and it moves in an upright cylinder which is closed at the upper end. When the stamp is displaced in an upward direction by the cam the piston compresses the air within the cylinder, and after the action of the cam has terminated the compressed air assists the attraction of gravity in forcing the stamp upon the material. The same result may be gained if a spiral spring is arranged within the cylinder, and an additional effect is obtained if both the spring and the air are employed. The upper end of the cylinder may be raised or lowered so that the degree of compression may be varied according to circumstances. Two claims are made for the method of aiding gravity by means of the compressed air and spring.

General Mining.—Accounts to December 31 submitted in April, but an interim meeting is held in November. Dividend for 1884, 5 per cent; for 1885 and 1886, $3\frac{1}{2}$ each year; and for 1887, £4 13s. 9d. per cent. Reserve fund, £29,850.

Low Point.—The vendors' shares, up to the end of 1888, do not rank for dividend until 7 per cent. per annum dividends have been paid on ordinary. Accounts to Dec. 31. For 1887, 5 per cent. was paid on the ordinary shares other than those held by the General Mining Assoc., that Company foregoing their dividend rights.

North-Western Coal.—The deferred shares receive on dividend until 15 per cent. per annum (cumulative) has been paid on the ordinary. Accounts to June 30. Dividend for 1887-8, 5 per cent.

Sydney and Louisburg Coal.—Accounts to Dec. 31 submitted about May. Out of the profits of 1884 one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,574.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200. Reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £450,000; purchase consideration, £400,000, in cash or shares. Fully-paid shares issued to the vendor; partly paid to the public.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital of £100,000, of which £80,000 was the first issue. Most of the shares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1885. Accounts to October 31 submitted in March. No dividend yet. Debentures, £3,450. Reports are not obtainable, but this information is official.

Anglo-Canadian Phosphate.—The preference shares rank first for 7 per cent., and after a like rate has been paid on the deferred shares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £2,576, which was carried forward.

White's Asbestos.—Registered April 9th, 1889. The authorised capital is £100,000; first issue, £60,000, of which £20,000, fully paid, was issued to the vendor.

Coal Mining in Nova Scotia.*

By E. GILPIN, JR., A.M., F.G.S., F.R.S.C., etc., Deputy Commissioner and Inspector of Mines for Nova Scotia.

The earliest discoverers do not mention coal in their accounts of Cape Breton, although its outcrops in the sea cliffs are visible for miles. The first printed account is found in Denny's work, published in 1672. In 1711 considerable amounts of coal were taken away by the French and English, being broken out by crowbars and loaded into boats. The building of the great fortress of Louisberg in 1720 led to the first regular coal mining in the Island of Cape Breton. The great numbers of artificers, soldiers, etc., engaged in its construction were supplied with fuel from the ten feet seam on the north side of Cow Bay, now known as the Block House seam. These old workings were carried on above water level, and can still be entered.

During the English occupation of Cape Breton from 1745 to 1749, the beds of coal at Burnt Head and Little Bras D'Or were drawn upon for fuel, and block houses were built to protect the workmen against the Indians and pirates. In 1752 the pit at Burnt Head took fire, and the fort and other buildings were burned. The traces of the fire are still visible for nearly a mile along the outcrop of the seam. From this date until 1784, when Cape Breton was erected into a province, little was done in the way of coal mining. No satisfactory leases were issued, and the records show little beyond the supplies of fuel dug by the soldiers for the garrison at Halifax, and the steps taken to prevent theft of the coal by Americans, etc.

In 1820, when the island became part of the Province of Nova Scotia, more decided steps were taken, and considerable amounts of coal were mined from the Sydney main seam. Finally, in 1827, all the mines of the province passed into the hands of the General Mining Association of London. It may be remarked here that in the Pictou and Cumberland districts the coal seams attracted less attention, as they were not so accessible as in Cape Breton; but previous to 1827 numerous attempts were made to open mines in Pictou County. The causes of the ill success of all these ventures hitherto made were the excessive royalties charged, the shortness of the leases, two to five years, and the want of a regular market.

From 1785 to 1827 the annual coal sales in Cape Breton varied between 2,000 and 11,000 tons. The selling prices per ton being about \$2.50. The royalties charged were from 60 to 90 cents per ton.

The transfer of the Crown mineral franchises of the province was a curious one, and marks almost the last of the excessive prerogatives exercised by the English crown in colonial matters. The Duke of York having become greatly embarrassed financially, his brother King George the Fourth, by an act of the Royal prerogative, granted him for 60 years all the mines and minerals of the province, subject to certain rents and royalties, for the purposes of the provincial civil list. This princely gift recalling the generosity of eastern potentates, was transferred by the Duke of York to the great firm of London jewellers, Messrs. Rundell & Bridge, who had organized the General Mining Association of London, for the purpose of acquiring and working mines in various parts of the world.

This company expected at first that the copper ores of Nova Scotia would prove a source of revenue to them, but after a careful mineral survey they decided to turn their attention to

the coal deposits. They vigorously opened mines at Sydney, Bridgeport and Lingan in Cape Breton, in Pictou County at a point now known as Stellarton and at the Joggins in Cumberland County, and worked them with varying success up to the year 1858, which saw the opening of a new page in this history.

The monopoly was at first viewed with great approval in the province, and the immense expenditures necessarily involved in starting these mines, and their equipment of foundries, machine shops, tramways, etc., were favourably received by a scattered population, entirely engaged in farming, fishing, and lumbering. In a few years however, as population and enterprise increased, the restrictions of so great a monopoly began to cause irritation, which found expression in many an angry speech in the Provincial Legislature. Finally in 1858 the General Mining Association agreed with the province that they would retain for a term of 18 years certain large tracts of coal lands, with powers of extension under lease, and surrender for ever all other coal seams and other minerals. The consideration for this was the reduction of the royalty on large coal to 4^s d, and the abolition of the fixed rent of £3,000 per annum. The General Mining Association under this agreement retained possession of 46 square miles of coal lands. These areas were selected by Mr. R. Brown, then their general manager, with excellent judgment. His work on the coal fields of Cape Breton gives the coal mining history in full detail.

By the judicious and well timed compromises made by the four parties interested—the crown, the representatives of the Duke of York, the Province of Nova Scotia, and the Association, a happy settlement of this great monopoly was arrived at. The incubus of a single corporation, owning by an unassailable title the varied minerals of a province, in great measure settled by those who left the rebel colonies to live under the English flag, was happily removed in time to prevent the development of feelings inimical to the powers that thoughtlessly perverted the guerdon of nature to those who had, by the greatest possible test, demonstrated their loyalty.

The energy and wealth of this company was of great benefit to the province, and its conduct and that of its chief officers has ever been honourable, and calculated to set an example of honesty and reliability. The Association has now disposed of all the coal lands owned by it in Nova Scotia proper, and retains its selections in Cape Breton, operating chiefly in the historical Sydney main seam, which has been drawn upon by the miner for over one hundred years.

The natural result of the unlocking of so vast an amount of possibilities of mineral wealth beyond the dreams of avarice followed this settlement. The development of the gold, gypsum and other minerals immediately followed the period during which the simple farmer doubted if clay were a mineral or not. The government upon the completion of the agreement threw open the coal districts, and leases were readily obtained. A large number of collieries were opened and much speculation indulged in. The 24 per cent. *ad valorem* duty on coal going into the United States having been removed in 1853, it was anticipated that an unbounded market was assured. The total sales in 1858 were 226,725 tons, of which 186,743 were sent to the States. From this date up to 1867, when a duty of \$1.25 was imposed, the exports to the United States had increased to 404,252 tons out of a total sale of 471,185 tons.

In 1872 the duty was lowered to 75cts., when the United States took 154,092 tons out of 785,914 tons sold. Last year the States took

73,892 tons (of which about 50,000 tons were smalls) out of a total of 1,519,684 tons sold. These figures show the steady growth of the home markets, and the fact that there is at present little room for Nova Scotia coal in the New England markets. The mutual removal of the duties on soft coal would, in the opinion of many of the provincial coal mine managers, result in the almost total loss of the Upper St. Lawrence trade, without any prospect of replacing it by a trade with the Eastern seaboard of the United States, which would have to start with a basis of at least 750,000 tons.†

The following tables show the coal sales to the United States for number of years, and the annual sales to all quarters by decades:—

*The ton of coal in this paper is 2,240 lbs.

COAL.

NOVA SCOTIA EXPORTED TO THE UNITED STATES.

United States.....	73,892
Other countries.....	151

Total..... 1,519,684

The limits of this paper would be too extended were the geological and chemical particulars of the Nova Scotia coal beds to be given here, and the author trusts that at some future time the society may see fit to allow a description of them to find a place in the transactions.

The coal of Nova Scotia is bituminous and frequently coking, the differences in quality between the various districts being referable perhaps to local conditions of pressure, etc. Stratigraphically the Cape Breton seams hitherto worked are flat lying, those of Pictou and Cumberland are pitching, the average of the former being, say, 1 in 10, of the latter 1 in 3. The thickness of the seams worked in Cape Breton varies between 4 ft. 9 in. and 9 feet, of the Pictou seams 4 to 15 feet, and of the Cumberland seams 3 ft. 6 in. to 11 feet. The conditions of floor and roof vary in each mine but do not present any striking peculiarities. In the thicker seams when the roof is bad, it is sometimes

*Paper read before the Canadian Society of Civil Engineers.

practicable to leave on a few inches of coal to assist in supporting it. In some cases this coal is recovered when the pillars are drawn.

The earliest operations in the pitching seams of the Pictou district were conducted by sinking pits to gain successive lifts. The Pictou main seam, having a thickness of 38 feet, has so far been mined on two systems, of which the following account, taken from a paper read by the author a number of years ago before the North of England Mining Institute will serve as a description. The first system has now been abandoned, but it is interesting, as by it the coal was taken to the full height.

Levels were turned right and left from the pit, and when the shaft pillar was won, incline or gate roads were driven uphill, one half on the angle of the seam every 50 yards. Six "bords" or working places, 18 feet wide, were turned away as the gate road went up, parallel to the levels, and at distances far enough apart to secure pillars 8 to 10 yards thick. Eighteen inches of coal were left on as a roof. These "bords" were driven 12 to 15 feet high and continued until intersected by the next "gate" road. Rails were laid up the gate roads and into the bords, and over them the tubs, holding 12 bushels, were drawn by horses, into the working faces, filled, and taken down to the level. The force of the loaded tub descending the inclined gate road was lessened by fastening to the rear of the tub a loose chain passing round a stout post, fixed at the head of the gate road, and dragging on the ground.

When it was determined to work the lower division of the seam, the same gate roads were driven level until the bottom of the coal bed was reached, and then continued as before. The second lift of 15 to 20 feet in height was taken

out in bunches of regular open cast work in the former bords already worked on the top of the seam. Beams of 6 inch timber placed horizontally at the level of the pavement of the former bords secured the sides of the pillars, and if the roof proved bad, props were set on them. This plan of working was attended with much danger to the miner. His eye could not reach the roof of these murky chambers, and his candle's gleam was reflected only by the white fungus which covered the timber. The shape of the pillars at right angles to the dip, narrow, and having long jibs, was not calculated for strength. The dip of the seam rendered the course of the bords imperative, and the ribs were weakened by the cleat of the coal running obliquely across them. These pillars were never robbed, and have now nearly all crushed. As considerable amounts of gas were given off, ventilation was attended with difficulty, and serious fires happened, some of which were put out only by filling the workings with water.

The plan now most in favour is to drive a "balance" 10 feet wide and 10 feet high from the level straight to the rise of the seam for a distance of about 450 feet. One or more parallel airways are driven at the same time, and of smaller dimensions, in order that the necessary air may be carried uphill and down again as the work progresses. Two tracks of about 2 feet gauge are laid in the balance to within 20 feet of its face. Upon one of these tracks is placed an empty tub to be filled with ballast, on the other a truck having its floor made level through one pair of wheels being greater in diameter than the other. A section of rail corresponding in gauge to that used in the pit is laid on the platform.

(To be continued.)

POSITION WANTED.

A practical Certificated Colliery Manager is open for engagement. Twenty years experience in every system of Coal Mining in some of the largest collieries in the North of England and in Nova Scotia. Large experience in sinking and timbering shafts.

Address:

COLLIERY MANAGER,
Canadian Mining Review,
Ottawa, Ont.

LEDOUX & COMPANY,

10 CEDAR ST, NEW YORK,

Engineers, Metallurgists & Assayers.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY

Made in any size from 9 inches to 16 ft. diameter with original bores of 3 and 3½ inches, bushings to be used for intermediate sizes; larger ones bored to order.

WE ALSO MANUFACTURE

WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.

22 or more sizes of Shafting. 200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to **The Dodge Wood Split Pulley Co., 111 Adelaide Street West, Toronto.**

CRUDE AND MANUFACTURED FOR ALL PURPOSES.
Cloths, Packings, Furnace Cements, Paper, Stove Linings, &c.

SPECIALTIES: FIREFELT, a flexible Asbestos Sheet, made in tubular sections and rolls, best and most durable non-conductor made.
SUPERATOR, a strong fire & waterproof fabric for sheathing & roofing buildings, fire proofing boiler rooms, &c.

THE CHALMERS-SPENCE CO.,

419 TO 425 EIGHTH ST., NEW YORK.

ASBESTOS.

The Ventilation of Mines.—Recent explosions in mines have again brought into discussion the very important question of the quantity of air required to be sent into the workings of a mine, and it may be remarked that what would be sufficient in one mine might not be sufficient in another, so much depending upon the nature of the workings, on the strata, and other matters. In one case, indeed, where there was a sudden outburst of gas, a powerful fan was working, sending at the rate of 220,000 cubic feet of fresh air per minute through the mine, yet that was insufficient for preventing the air and gas combining to an inflammable point even in the fan drift. In another case 14,000 cubic feet per minute were sent into one portion of a mine, but was ineffectual in preventing an explosion. Opinions vary a good deal, however, with respect to the quantity of air that should be sent into mines under certain conditions. Mr. J. T. Taylor, in his evidence before a select committee, said the quantity depended upon the condition and requirements of a mine. In a mine which yielded no firedamp, he said, "I should say that a current of 20,000 to 30,000 cubic feet per minute might be a fair quantity being properly conveyed up to the face of the workings and made to sweep those districts where the people were employed; but in a fiery mine I should require very much more than the quantity named." For vital chemical purposes alone, Mr. Richardson has estimated that there should be allowed, per hour, for breathing 84 cubic feet per man; for displacing carbonic acid, 62.8; for diluting nitrogen, 258.4; for displacing perspiration, 27.0; for the combustion of one light, 59.3; and for one-fifth of that needed for a horse, 517.0, making a total of 1,008.5 cubic feet. But even this does not provide for quite diluting the gases to a point whereby they would be no longer injurious, nor for removing the air after it has been treated, especially where a number of men have been continuously at the face of a rock. Indeed, experience has shown that a highly ventilated mine may be suddenly inundated with an explosive mixture paralysing for a time the most active agency of ventilation, so that the safety lamp alone has had to be relied upon for the escape of the workmen, thus showing that in a mine where gas is known to be given off in considerable quantities, any calculation as regards the quantity of air supplied to the workings cannot be looked upon as reliable. There should be no measuring of that element which is really vital to those working underground, but that the supply of air should be as large as possible and at the same time continuous, the stream being forced into all parts of the mine. Still, it is well that the question of air in mines should at all times occupy the attention of managers, and that they should be acquainted with the quantities of air individually required even where there is comparative, if not entire, freedom from explosive gases, and it is with this object in view that attention is again drawn to the subject of the ventilation of mines.—*Colliery Guardian.*

A Large Wire Rope.—One of the largest, if not the largest wire ropes manufactured in Great Britain, was recently despatched from the works of Dixon & Corbett and R. S. Newall & Co., Gateshead. Its length is 4,560 yds. and its circumference 5 inches, and it weighs over 23 tons, and it occupied three large railway trucks. It will be used by the North British Railway Company for drawing trains from Cowlands Station to Glasgow.

TENDERS.

SEALED TENDERS, marked "For Mounted Police Provisions and Light Supplies," and addressed to the Honourable the President of the Privy Council, Ottawa, will be received up to noon on Tuesday, 18th June, 1889.

Printed forms of tender, containing full information as to the articles and approximate quantities required, may be had on application at any of the Mounted Police Posts in the North-West, or at the office of the undersigned.

No tender will be received unless made on such printed forms.

The lowest or any tender not necessarily accepted.

Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to ten per cent. of the total value of the articles tendered for, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the service contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to newspapers inserting this advertisement without authority having been first obtained.

FRED. WHITE,
Comptroller, N. W. M. Police.

Ottawa, May 10th, 1889.

SEALED TENDERS marked "For Mounted Police Clothing Supplies," and addressed to the Honourable the President of the Privy Council, Ottawa, will be received up to noon on Friday, 31st May, 1889.

Printed forms of tender containing full information as to the articles and quantities required, may be had on application to the undersigned.

No tender will be received unless made on such printed forms. Patterns of articles may be seen at the office of the undersigned.

Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to ten per cent. of the total value of the articles tendered for, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to newspapers inserting this advertisement without authority having been first obtained.

FRED. WHITE,
Comptroller, N. W. M. Police.

INSOLVENT NOTICE.

In the matter of **BRADFORD L. NOWELL & Co.**, of the City of Montreal, Insolvents.

Lands and Phosphate of Lime Mining Rights in the Province of Ontario and Quebec for Sale by Authority of Justice.

I am instructed by the undersigned Curator to sell by Public Auction, within my Sale Rooms, No. 1747 Notre Dame St., on

Tuesday, the 28th day of May next,

At 11 o'clock in the forenoon,

All and singular those certain tracts or parcels of land and premises situate, lying and being in the Township of Loughborough, in the County of Frontenac, in the Province of Ontario, and more particularly described as follows, to wit:

LOT No. 1.

Ninety acres, more or less, of the North part of lot Number Six, in the Tenth Concession of the said Township, described as follows: commencing at the North-East angle of said lot, thence West the width of said lot or thirty chains, thence South along the side line thirty chains, thence East thirty chains, thence North thirty chains to the place of beginning. Together also, with all mines and quarries of metals and minerals, in or under the land upon that portion of said lot being West of the West Bay or Gold Lake, whether already discovered or not, with liberty of ingress, egress and regress for the purpose of removing the same only.

LOT No. 2.

All the Phosphate of Lime in and upon lot Number Ten, in the Eleventh Concession of the said Township of Loughborough, with full, free, irrevocable sale and exclusive license to mine and work all and every one of the mines, veins and seams of Phosphate of Lime opened as well as unopened, in and upon the said lot without any interruption, claim or disturbance from or by the Proprietor of said lot or any other person whomsoever, and to carry away and dispose of all such Phosphate of lime as may be found therein, to and for their own use and benefit and for the purpose aforesaid to sink and make shafts, pits, levels, trenches, ways, gates and watercourses, and to erect and use any machinery, workmen's or other houses, and to use all lawful ways and means whatsoever for finding and removing the said Phosphate, and also to take and use sufficient ground, heaproom or pitroom, for placing the said Phosphate and for leaving the waste, refuse or rubbish to be from time to time produced from the said mines, and also with the full and free liberty to erect, construct or use any part of the said premises, or any roads or ways therein for any purposes connected with the said mines, and the removal, sale and delivery of the produce thereof, provided in so doing they do not injure the crops or other property on said lot.

LOT No. 3.

All the Phosphate of Lime and the full rights to mine the same in certain parcels or tracts of land situate, lying and being in the Township of Buckingham, in the County of Ottawa, in the Province of Quebec, comprising 200 acres more or less, and being west half of lot 21, and east half of lot 22, of the Eleventh Concession of the said Township of Buckingham. These rights are wholly undeveloped, no mines having as yet been opened on the property.

The lots will be sold separately, subject to existing mortgage and the reservations, limitations, provisions and conditions expressed in the original grant from the Crown.

Terms cash, or half cash, and the balance on approved security at three and six months.

All information can be had on application to the undersigned,

SAMUEL C. FATT,
Curator.

WILLIAM H. ARNTON,
Auctioneer.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall, within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

LAUNCH, MONTREAL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed, we can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

WM. H. DICKSON,
160 Waller St., Ottawa.

THE CANADIAN MINING REVIEW
OTTAWA.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting Agricultural Fertilizers came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

January, 1889.

ONTARIO

Mining Regulations.

The following summary of the principal
provisions of the General Mining Act of
the Province of Ontario is published for
the information of those interested in
mining matters in the Algoma District,
and that part of the Nipissing District
north of the Mattawan River, Lake Nipis-
sing and French River.

Any person or persons may explore for
mines or minerals on any Crown Lands
surveyed or unsurveyed, not marked or
staked out or occupied.

The price of all lands sold as mining
locations or as lots in surveyed townships
is two dollars per acre cash, the pine timber
being reserved to the Crown. Patentees
or those claiming under them may cut and
use such trees as may be necessary for
building, fencing or fuel, or for any other
purpose essential to the working of mines.

Mining locations in unsurveyed territory
shall be rectangular in shape, and the
bearings of the outlines thereof shall be due
north and south, and due east and west
astronomically, and such locations shall be
one of the following dimensions, viz: eighty
chains in length by forty chains in width,
containing 320 acres, or forty chains square,
containing 160 acres, or forty chains in
length by twenty chains in width, con-
taining 80 acres.

All such locations must be surveyed by
a Provincial Land Surveyor, and be con-
nected with some known point or boundary
at the cost of the applicant, who must file
with application surveyor's plan, field notes
and description of location applied for.

In all patents for mining locations a
reservation of five per cent. of the acreage
is made for roads.

Lands patented under the Mining Act
are free from all royalties or duties in re-
spect to any ores or minerals thereon, and
no reservation or exception of any mineral
is made in the patents.

Lands situated south of the Mattawan
River, Lake Nipissing and French River
are sold under the Mining Act at one
dollar per acre cash.

Affidavits showing no adverse occupa-
tion, improvement or claim should ac-
company applications to purchase.

A. S. HARDY,

Commissioner,

Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or
to work Minerals on any of
their Mining Lands and

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

A Remarkable Hoisting Record—On March 26th the J shaft of the Chicago, Wilmington, and Vermilion Coal Company, at Braidwood, Illinois, hoisted 1,655 tons of coal in 9½ hours. This, while the best hoisting record yet made, is said to be not the maximum, and it is expected to run this up to 2,000 tons in the near future. The J shaft is 92 feet from the surface to the coal, and it was sunk in 17 shifts in 1885. There are 200 rooms in it and about 700 miners are employed. The shaft is equipped with Cherry's self-dumping cages, and Ramsay's box-car trimmer. The cages are raised and lowered by a double hoisting-engine with 14-inch cylinders, 18-inch stroke, geared to a drum 6 feet in diameter. The following is a detailed statement of the work done: Average weight of pit cars, 1,408 lbs. Tons per hour 174.22. Tons per minute, 2.90. Pit cars per minute, 4.12. Miles run by cages 106.62. This shows that to hoist 1,655 tons nearly 2,350 mine-cars were hoisted.

A New Use For Graphite.—A new use of Graphite consists in its application to wire rope. Wire rope is expensive, and is rapidly coming into a much larger consumption. It is largely used in distant fields and mines, where break-ages cost double and treble the usual expense of repair, so that a wire rope preservative is literally a boon. This is found in Graphite. The Graphite must be pure and only the flake is useful. This graphite is then prepared by the same firm in a grease which makes the application of the Graphite to the wire rope easy. Have a tinsmith make a tin tube, trumpet shaped, the small end just large enough to fit the circle of the rope, the other end large enough to carry two or three pounds of the Graphite grease. The rope travelling through this tube will coat it nicely—one coating in two weeks is enough, and this practice alone will double the length of life of the rope. The graphite prevents the wire from rusting—it saves the rope from abrasion when striking hard substances; it also prevents the wires forming the rope from abrasion one against the other as the Graphite finds its way into and fills the minutest spaces and is held there by the fatty substances in the mixture. The facts above are furnished from his own experience by one of the leading mining engineers of the country.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High
Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

The Canadian Mining Review

CONDUCTED BY . . . B. T. A. BELL

OFFICES:

UNION CHAMBERS, 14 Metcalfe St.

OTTAWA.

Vol. VIII. JUNE, 1889. No. 6.

Notice to Correspondents.

Being desirous of publishing our next issue on the 15th inst., our Correspondents will greatly oblige by furnishing their usual Contributions *not later* than the 12th July.

Scientific Agriculture.

The publishers beg to announce that the Review's Annual Exhibition Supplement will be entirely devoted this year, to the subject of scientific agriculture, particular emphasis being laid upon the value and importance of Canadian phosphates and phosphatic manures as a means of enriching the soil. Arrangements have been made for a series of articles of special interest to the Canadian farmer, among them the following:

Agricultural Fertilizers—By Dr. FRANCIS WYATT, New York.

The Soil—By ANDREW H. WARD, Agricultural Editor of the *Boston Herald*.

The Application of Finely-Ground Phosphate of Lime—By Prof. A. F. GUERARD.

The Occurrence of Phosphates in Nature—By Dr. G. M. DAWSON, Assistant Director Geological Survey of Canada.

Nitrates v. Phosphates—By W. H. IRWIN, London, Eng.

The Importance of Phosphates and Phosphatic Manures to the Canadian Farmer—Excerpted from the various Official Reports of the Hon. JOHN CARLING, Minister of Agriculture.

It has been decided to furnish every farmer in the provinces of Ontario and Quebec with a copy of this issue.

Readers of the Review desirous of obtaining extra copies for distribution among their friends will please send in their orders now, in order that due provision may be made before going to print.

Advertisers desirous of reaching the mining and agriculture classes will find this issue a valuable medium, admirably adapted to their purpose; contracts are being made now, and the spaces are rapidly filling up.

Mineral Wealth of British Columbia.

The Report of Dr. George M. Dawson, F.G.S., Assistant Director of the Geological Survey of Canada, on the mineral wealth of British Columbia, is so complete in its general bearings, viz., history, geography and geology of that country, that all who may have the privilege of reading it cannot fail to be interested and instructed; and particularly those who are now, or have been engaged in mining pursuits; and to such, the fact that so much mineral has been, and is being wrought, must be astounding.

There can be no manner of doubt as to the future of this new country ranking with the foremost countries of the world in a commercial point of view, and at a very early date; particularly so, as the facilities for transportation by land and sea are now complete, and thereby linked with the whole world.

In a concise form, reference will be made to the enormous wealth in gold, coal, and other minerals that have already been taken out in past years, when transportation in that country was confined to the old principles of portaging and land carriage, to say nothing of the crude mining appliances used by miners in those early days.

Comparing this imperfect and defective machinery with that of to-day, which science and practice have perfected, and which enables the miner and mill man to overcome difficulties that in those early days would have been insurmountable.

These improvements, coupled with the rapid developments of this country, should induce us to accept this field as one demanding our immediate attention, time and money.

The Report is the result of very careful investigation and compilation, and shows an utter absence of the desire to "boom." It savors of modesty and truthfulness throughout, and is written, as it states, with a twofold object, viz: Firstly, "As an exponent of the mineral wealth, and to provide an answer of a general kind to enquiries so frequently made; and secondly, "designed to place in the hands of the prospector or miner a constant synopsis of facts."

The Province of British Columbia has an area of 390,344 square miles, includes a length of 800 miles of the Corderilla mountain belt, a region of mountains very much disturbed geologically, and which has, between the Pacific Ocean and the elevated margin of the great plains, a breadth averaging about 400 miles. The mountain range extends north east and south-west, and represents the northern continuation of the most important metalliferous area of the United States.

The "Corderilla belt" in British Columbia has four great mountain systems, which run nearly parallel to each other and the coast, and known as "The Rockies," "The Gold," "The Coast," and "The Vancouver" ranges.

1st. The Rocky Mountain range is the furthest inland, and has an average breadth in the southern part of about 60 miles, but this is decreased near the Peace River to 40 miles or less.

Near the 49th parallel several summits occur in this range which exceed 10,000 feet in height, but above the sources of the North Saskatchewan and Athabaska the range appears to culminate, the mountains "Prown" and "Murchison" occur with separate heights of 16,000 feet and 13,500 feet respectively.

More or less snow fields occur in many places, and true glaciers are found at the heads of the

Bow, North Saskatchewan and Athabaska rivers.

The mountains are well timbered wherever sufficient soil exists for the support of the trees, and owing to the greater rain fall on the western slopes of the range, the forests are there very dense.

The geological formation of this range is somewhat varied. Crystalline slates and granites are scarcely known in any part of this range between the 49th and 60th parallels. The rocks belonging to the Cambrian and carboniferous formations being about 28,000 feet in thickness are found in the Bow River region carrying deposits of copper and galena. There is also found basins of rocks of the Cretaceous age, and in these beds anthracite and bituminous coals are found.

On the south-west side of this range is a straight wide valley, traceable for 700 miles from the 49th parallel to the head waters of the Peace River. It is watered by the sources of the Kootanie, Columbia, Fraser, Parsnip and Finlay rivers.

Placer gold has been found and worked at a number of points along this valley, and important discoveries of various ores are now being made near Upper Columbia and the Upper Kootanie rivers.

2nd. The next mountain system is to the south-west of the "Rocky" Mountain, and referred to as the "Gold" range. The Purcell, Selkirk and Columbian ranges constitute its southern part, while to the north lie the Cariboo, Omineca and Cassiar mountains. The highest mountain is Mount Donald, measuring 10,645 feet in height, and lies on the line of the Canadian Pacific Railway. Granites and slates of old ages, together with great masses of palæozoic rocks, prevail in this range, and it may be regarded as the most important metalliferous belt of the province. Discoveries have already been made of gold and silver ores; also of argentiferous galena.

Between this range and the coast range lies the interior plateau of British Columbia, having an average width of 100 miles, and lies at an elevation of 3,500 feet. It is traversed in various directions by a system of trough-like valleys of erosion, generally occupied by streams and rivers.

The tertiary rocks of this plateau hold in many places beds of lignite. These plateaus also present some important granitic areas. As a metalliferous region it is destined to take high rank. Placer gold deposits have been worked, and platinum is abundant in the Similkameen region.

The Cascade range of Oregon and Washington is largely composed of eruptive volcanic material, to which its characteristic features are due (viz., Cascade), though these materials rest upon a basis of older rocks.

Near the mouth of the Fraser River its place is taken by a new mountain system geographic-

ally and geologically distinct, in the composition of which volcanic ejectamenta play no prominent part.

3rd. The "Coast" range has an average width of 100 miles, and consists of numerous constituent ridges. The altitudes of the higher summits are from 6,000 to 7,000 feet. Glaciers are of frequent occurrence and of large size. The mountains are rugged and well timbered. Geologically this range owes the greater part of its elevation to a period later than the Cretaceous, of which formation patches are found in them at great heights. The rocks consist of grey granites and gneises and other crystalline schists, as well as palaeozoic. In the latter rocks gold placers occur locally, whilst copper and iron ores are frequently found, and rich silver ores have been discovered.

4th. The "Vancouver" range is to a considerable extent formed of crystalline rocks like those of the coast ranges, principally composed of the Palaeozoic and Triassic age, and is flanked in places (both in Vancouver and on Queen Charlotte Islands) by Cretaceous rocks, which are important because of their coal bearing character. The areas underlaid by these rocks are generally comparatively low and hilly rather than mountainous, while a large tract of level land based upon the Tertiary formation occurs in the north-east part of Queen Charlotte Island. Gold placers have been worked in several places in Vancouver, but few ever attained much importance. Iron, copper, lead ores and gold bearing quartz have been discovered, but up to the present time the coal deposits have proved to be vastly its most important feature.

British Columbia first rose from the position of a fur country to the rank of a colony on the discovery of gold upon the Lower Fraser in 1858. Its subsequent history for a number of years is substantially that of the sudden rise and subsequent slow decline in importance of placer gold mining. Coal mining has, however, concurrently advanced slowly but steadily till it has attained its present pre-eminent position. With respect to vein mining proper we have as yet to chronicle merely the first steps; but in the southern part of the province the completion of the Canadian Pacific Railway has at length forwarded the necessary impetus in this direction. Everything which has been ascertained of the geological character of the province as a whole tends to the belief that so soon as similar means of travel and transport shall be extended to what are still the more inaccessible districts, these also will be discovered to be equally rich in minerals, particularly in the precious metals gold and silver. In the southern district, for which information is most complete, praiseworthy efforts are now in progress at a number of widely separated localities, toward the exploitation of ores, which in many cases have already been proved to be of an exceptionally valuable character. Hence it is, that every reason is entertained for witnessing the inauguration of an

era of mining activity of the most important kind.

While it is affirmed that gold is very generally distributed over the entire area of the Province of British Columbia, so much so that scarcely a stream of any importance in which at least colour of gold may not be found, the principal discoveries of important mining districts have been found along the systems of mountains and high plateaux which comprise the Purcell, Selkirk, Columbia and Cariboo ranges and their north-western continuations lying to the south-west of the Rocky Mountain range. Of all the gold producing districts, that of Cariboo has proved the richest and steadiest producer. The estimate of the yield of gold from the year 1858-1888 being \$54,108,804. The whole of this amount, with the exception of a small quantity of bullion (obtained from a quartz mine) is entirely due to placer mining.

The condition of workable auriferous lodes yet remain to be studied in detail and discovered as the development of mining of this kind progresses.

With regard to the silver ores of British Columbia, there is every reason to believe that before many years elapse the province will take its place as one of the great silver producing regions of the world.

Argentiferous galenas appear to be the most abundant ores, and the knowledge of these already obtained is sufficient to enable the silver belt to be traced from point to point from the international boundary north-westward to the 60th parallel of latitude (forming the northern boundary of the province) and beyond it to Forty Mile Creek, where the Yukon leaves the North-West Territory to enter Alaska. The belt thus defined is about 1200 miles long, and wherever it has been explored and prospected highly argentiferous galena ores have been found. Most of the discoveries so far made are those in the southern part of the belt, within easy distance of the Canadian Pacific Railway, and from analyses made these ores are in some cases exceedingly rich, running from 100 to 1700 ounces of silver to the ton, besides carrying gold, copper and lead in good percentages. In these same districts cinnabar and copper ores have been found.

To those of our readers unacquainted with this country it will be surprising to learn that there are four large collieries in full operation, employing 2000 men. The output for these collieries since 1853-1888 is about $4\frac{1}{2}$ million tons, the markets being California, San Diego, Oregon, Alaska, Hawaiian Islands, China, Japan, besides Her Majesty's naval and other mail and trading steamers.

The analyses given of these coals are very surprising, being equal and in many cases superior to the North of England and Welsh coals. It is claimed that the evaporation power is 13.41 lbs. water per lb. of fuel. In practical work 9 lbs. is about the highest service attained, but 13.41 lbs. can be got by experiment,

The anthracite coals analyse very well, but do not (as claimed) compare with the Pennsylvania anthracites, but are, at the same time, a good marketable coal.

Carbonate iron ores are found in this coal formation. These, with the mixtures of the magnetites and hematites should produce a good pig-iron and start the manufacture of finished iron and steels.

The building stones found at the different places, such as the pink and grey granites, sandstones in variety, together with marbles of all hues, are pronounced of good quality and well suited for construction purposes.

In conclusion, it is to be hoped that wise and proper means will be adopted to preserve the high standard of merit that this new field possesses, in order that confidence when established may be maintained, and that the prospector, the miner and capitalist may work harmoniously together, having for their motto "Unity is strength."

LETTERS TO THE EDITOR.

Coke, or Charcoal?

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The text of a bulletin, in which the progress of smelting at the Sudbury Copper Mines has been connected with the announcement of a proposed coke iron furnace at Trenton, Ont., and all to show the necessity for the free importation of coke, has been going the rounds of the press. It is most desirable to afford every facility for the reduction of ores, and if the importation of coke is essential to attaining economic results for the enterprises springing into life in the Lake Superior District, few would attempt to gainsay the calculations of experts who have doubtless considered the fuel question which heads this paper, "Coke, or Charcoal?" It is not therefore intended to offer any objection to the proposal to import coke, if such is intended. But it happens that the mineral interests of the Dominion affect a wider constituency than the United States, and to all our trans-atlantic friends who buy copper stocks or who may contemplate investment in Canadian mines the proposal to import a foreign manufactured fuel, rendered costly by long inland transportation before it reaches lake navigation, will at once give rise to the question, are there no forests in Canada? Whatever the opinion entertained by American experts on the merits of coke fuel, it is a matter of duty to communicate the information that within sight of Sudbury, and within a very few miles from any iron or copper mine in the Province of Ontario, are immense forests of the best hardwood fuel, and that charcoal kilns can be erected and the fuel manufactured of the best quality at a varying cost of \$6 to \$7.50 per ton of 2000 lbs. for hardwood coal, and \$2.90 to \$4.50 for softwood coal.

The historic fuel for copper is charcoal. Overman says that certain Norway and Sweden brands of copper are remarkable for their purity, testifying to the careful metallurgy attained by the people of these countries with

charcoal fuel in the manufacture of copper as in iron. The copper reduction processes of Germany as described by Ure are made with charcoal. The highest quality the smelter can turn out is demanded by the electrician, and it would seem that his requirements may be best attained by the use of charcoal. "The higher temperature at which reduction proceeds carries more impurities into the metal," is the theory of Belani for the relative inferiority of coke to charcoal. And this higher temperature is due to the greater pressure of blast necessary for the combustion of coke, and is attended with a greater consumption of fuel. The surface presented by charcoal in the fissures and intercellular spaces in its structure is $5\frac{1}{2}$ times that of coke, and the rapidity of its ignition is as $1\frac{1}{2}$ to 1. A test conducted at Kingston, though not conclusive, supports the view that good hardwood charcoal in a horizontal fire will decompose jets of superheated steam effectively, and work quite as well as anthracite in the manufacture of water-gas. An attempt to generate the gas from steam passed through coke was a failure.

It is difficult to see why copper should be smelted with coke at Sudbury, Ontario, in the presence of abundant supplies of wood, when the silver smelting furnaces of Colorado are reported to be using "seven and a half millions of bushels of charcoal annually, which is made in meilers and kilns from Pinon pine, balsam and spruce wood, much of it dead timber from burned tracts." If the reason is that there are no charcoal-burners there will be no difficulty in importing them from Sweden. The Government of that country maintains a "School for Charcoal-Burners," in which the theory and management of meilers is taught, and so successfully that it is claimed that Swedish charcoal made "under dust" is superior to that obtained from American kilns, and the product equal in quantity.

Prof. Kerpely, a Hungarian expert of continental repute, in a report on the iron industry of his country in 1884, gives some information on a state of affairs there to a great extent on all fours with the fuel question in this country. He says: "The demand for raw material (for forges and mills) can only be met by increased imports or by building new blast furnaces. The Government is putting up two furnaces at Vajda-Hunyad. Until now 45 charcoal furnaces were running; in the future there will be 48. I cannot pass over the fact that some leading men who assume to be experts in iron-making, and unfortunately are acknowledged by many as such, have insisted recently that works using charcoal as fuel are doomed. According to these gentlemen, the majority of our blast furnaces, and those of our mills and forges using charcoal, should be demolished, and our iron industry be simply turned over to our competitors of neighboring countries. But these gentlemen know only too well that there are in Hungary more than 5,700,000 acres of forest, the greater part of which is only of use to iron manufacture. Even its use for building timber is profitable only when accompanied by using the waste for the manufacture of charcoal; foresters insist upon clearing the ground of this waste, and therefore both combined not only lead to a low cost for the charcoal, but even yield a small profit. It is certain that one half of the timber in our forests is beech, which can only be used as cordwood. The fact that the greater part of these forests is remote from the iron manufacturing districts is not nowadays an obstacle to the transportation of the charcoal, because a large part of the forests is within reach of our railroads, and because the adminis-

tration of the latter, in their own interests and in that of our iron industry, have put the rates so low that a number of works can now draw a large supply of charcoal from remote districts. Thus, forest areas which have been unproductive for decades can be worked to a profit, and a living is assured to thousands, besides increasing the taxable value of property. The importance of this movement from an economical point of view needs no further discussion. The manufacture of charcoal pig-iron does not therefore deserve adverse criticism, but should have the support of the trade and of patriotic men, particularly because the iron thus produced is far superior in quality to that smelted with coke or coal, and secures to us foreign markets. Even if decades from now, we were the only producers of charcoal pig-iron, after the latter has become scarcer and scarcer, and the demand has grown for certain purposes, that would not alone be a disadvantage, but would be a positive advantage, and with this prospect before us we should not diminish our production of charcoal pig-iron or ever abandon it."

In the place of Hungarian beech we have the Canadian maple, covering millions of acres of no value except for the manufacture of iron, or other smelting purposes. Made into charcoal, the process of coaling offers to the owners for every acre chopped and hauled to the meilers or kilns from \$30 to \$60, according to the amount of wood obtained. The importation of coke for copper or iron smelting offers to Ohio colliers and coke-burners and to American railroad and vessel owners a yearly increasing tribute from the industry of this country. And yet the profits which these proposed coke furnaces would forego may be found printed in every trade journal. "The Plymouth, Mass., rivet manufacturers use largely Swedish iron, which comes in the form of iron rods. They pay a duty of \$12 a ton of 2000 lbs. for 5 gauge upward, and below No. 5 a duty of 45 per cent. *ad valorem*. The rods cost from \$65 to \$70 per ton of 2240 lbs. The Swedish or Norway iron wire costs about twice as much as American wire." Here are the latest prices of No. 1 charcoal and coke iron per ton in the United States:—

CHICAGO.

Lake Superior Charcoal	\$18 50
Tennessee do	19 00
No. 1 Coke	16 00
Southern No. 1 Coke	15 75

CINCINNATI.

Hanging Rock Charcoal	\$21 00
Tennessee and Alabama Charcoal	18 00
Hanging Rock cold blast "	25 00
Southern Coke	14 50
Ohio Soft Coal	16 00

CLEVELAND.

No. 1 Lake Superior Charcoal ...	\$20 50
No. 1 Am. Scotch	18 00

LOUISVILLE.

Southern Car Wheel	\$22 75
Hanging Rock No. 1 Charcoal	21 00
No. 1 Southern Coke	14 75

Much might be said for processes which largely reduce the cost of charcoal fuel, such as Dr. Pierce's system of wood distillation, which is successfully operated in the United States. But as this would involve the presentation of technical details at some length, the subject is reserved for a future issue. The question, shall our metallurgical industries be operated with foreign coke or home-made char-

coal is one worthy of attention on every hand. It is simply the question whether our forests shall be of any value in the development of those industrial enterprises which it is the hope of the people may shortly arise to take away our reproach that we are a country of producers of raw material, and with the best iron ore and the best fuel in the world, know not how to make iron.

J. BAWDEN.

KINGSTON, 15th June, 1889.

A Visit to Port Arthur and the Silver Mountain Mining District.

To the Editor:

THE CANADIAN MINING REVIEW:

SIR,—Your correspondent having taken a trip with some friends to the Silver Mines, south west of Port Arthur, I have much pleasure in giving your readers a short account of our trip.

We left Toronto at 11 o'clock, p.m., per the C. P. R., on Thursday, the 25th April, arriving at Port Arthur, a distance of 857 miles, on Saturday, the 27th, enjoying a very pleasant journey. The scenery on the north shore of Lake Superior is very grand. Resting a few days at the Northern Hotel, one of the finest summer resorts in Canada, we started for the mines by train to Murillo Station on the C. P. R., thence by stage some twenty-eight miles to Silver Mountain, remaining over night at the Half-way House. In the district the following named mines are being worked:—The Beaver, Badger, Palisades, Queen, Silver Wolverine, Silver Fox, Elgin, Porcupine, Silver Creek, Big Bear, Silver Victoria and others, some of them turning out ore to the value of \$1,000.00 and upwards to the ton of 2,000 lbs.

The West End mine of Silver Mountain which has been actively developed, during the past year is rapidly becoming one of the largest and most valuable silver mines in the country. The mine is being opened in four places by shafts, drifts and cross cuts. The main shaft No. 1, now down about 200 feet, has been in continuous ore from the surface, and the levels which are run both east and west on the vein from this shaft, at a depth of 100 feet are all in ore, a part of which is very high grade. In shaft No. 2 a large body of high grade ore was struck a few feet from the surface, and at a depth of 60 feet drifts are being run east and west on the vein, the extent of this ore body is not yet known, it had been opened 70 feet in length, at date of our visit, and as work progressed was getting larger and richer, the bottom top and sides of the levels showed masses of native and sulphide silver assaying from 3,000 oz. to 20,000 oz. per ton. The other workings are not so extensive as the two last mentioned, but show a large strong fissure vein and considerable good ore which is continuous and will doubtless improve with depth. The mine is supplied with steam hoisting and pumping machinery, and the buildings, some twenty or more, are substantial and convenient.

The property consists of 240 acres of land $\frac{1}{4}$ of a mile on the vein, and is admirably situated for working purposes, has good water, and an abundance of timber for fuel and mining purposes. The Port Arthur, Duluth and Western R. R. which is to be built this season will pass this property. At this mine samples of ore are being produced equal to anything that ever came out of Silver Islet, pink ore, and in fact the same class of ore in every particular. The West End from its formation is destined to be a great

mine. The east end of Silver Mountain (Shuniah Weachu) is also turning out a large body of very rich ore; Crown Point, just north of Silver Mountain is also showing good results, rich ore being shipped to the United States from this mine.

Adjacent to Silver Mountain and Crown Point Mines is one of the most promising locations in the whole district known as R. 64 and has eight lodes crossing it, one being a continuation of the Silver Mountain lode and another that of Crown Point. This location is about to be opened up and, it is believed, will be found one of the richest mines in the district.

West of Silver Mountain is being found rich ore and some considerable work has been done. After a very enjoyable visit and being hospitably entertained by Captain H. K. Nichols and Mr. Woodruff, we started on our return for Port Arthur, and sailed from there by the Athabaska, one of the Canadian Pacific Railway Company's splendid steel steamships which traverse with safety and rapidity these magnificent inland seas of Canada. Arriving at Sau't Ste. Marie about 11 o'clock at night, I and the other passengers were attracted by the brilliancy of the electric light on the Canadian side. The town is lighted with the Heisler system of incandescent lights and these at a distance of over a mile from where the vessels lay were most brilliant, the buildings being quite easily discernible. Upon enquiry we found that 100 lights cost the town \$4.00 per night. This town is growing very rapidly owing to the fact that a new canal is being built on the Canadian side, as well as the C. P. Ry. having a branch road terminating there. We arrived in due time at Owen Sound, thence taking the train for Toronto.

Much surprise is expressed at the want of enterprise of the Canadian people, who allow the English and American capitalists to come in and capture the untold millions which lie slumbering in the silver mountains of the Thunder Bay mining district. Thoroughly enjoying the trip it is our intention to again visit the district, and we would recommend all our Canadian friends who can possibly do so, not to let the present summer pass without a visit to the mines, if only for the health giving properties of such a trip, and to see for themselves the magnificent mines of silver, and the wealth that they will yield in the near future. Some of the finest (well timbered) farm lands in Canada are to be found in the valley of the White Fish River. This beautiful valley is about forty miles long and about seven to ten miles in width, a few miles west of Porth Arthur.

Yours truly,

GEO. A. SHAW,

Lt.-Col. H. M. M's. Vice-Consul.

Toronto, 29th May, 1889.

Soapstone and its Uses.—A writer in a London journal calls attention to the unappreciated uses and preservative qualities of Soapstone, a material, he says, which possesses what may be regarded as extraordinary qualities in withstanding atmospheric influences those especially which have so much to do with the corrosion of iron and steel, and from experiments made it is said that no other material is capable of taking hold of the fibre of iron and steel so readily and firmly as this. In China, Soapstone is largely used for preserving structures built of sand-stone and other stones liable to crumble from the effect of the atmosphere.

Shipments.

The following have been the Shipments of Canadian Phosphate to British and European ports since our last issue:—

Date.	Vessel.	Destination.	Shipper.	Tons.
May 15.	S.S. Colina.....	Glasgow.....	Wilson & Green.	22
" 20.	" Oxenholme....	Liverpool....	" "	305
" 20.	" Fremona.....	London.....	Millar & Co....	375
" 22.	" Alcides.....	Glasgow.....	Lomer, Rohr & Co	400
" 22.	" Montreal.....	Liverpool....	" "	3 10
" 23.	" Castellano....	" "	" "	6 40
" 27.	" Henri IV.....	Havre.....	" "	150
" "	" Lake Ontario..	Liverpool....	" "	300
June 1.	" Kurweider....	Hamburg....	Wilson & Green.	251
" 1.	" Canopus.....	Liverpool....	" "	300
" 1.	" "	" "	" "	100
" 5.	" Michigan.....	London.....	Lomer, Rohr & Co	180

" 5.	" Lake Superior	Liverpool....	" "	180
" 5.	" Oregon.....	" "	" "	100
" 5.	" Saturnia.....	" "	" "	150
" 5.	" Zambesi.....	" "	" "	100
Total				4303

RECAPITULATION.

Lomer, Rohr & Co.....	2990
Millar & Co.....	375
Wilson & Green.....	938
Total	4303 Tons.

Liverpool	2525
Glasgow.....	822
London.....	555
Havre.....	150
Hamburg.....	251
Total	4303 Tons.

Ocean Freights.

Liverpool freights have been very plentiful, varying from 5 shillings to 7/6, and on one or two occasions even less. On the other hand London freights are extremely scarce, and shippers have to pay the regular liners from 10 shillings to 11/3 and even at these figures no vessels are obtainable, hence the bulk of phosphate is being shipped to Liverpool. There is an accumulation of over 4,000 tons of phosphate rock here in the harbour of Montreal waiting for tonnage.

British Fertilizer Market.

Messrs. Couper, Millar & Company, London, send us the following report:

"The position remains much the same as stated in our last circular, though since the Easter holidays business has been quieter. Nitrate of Soda is very depressed owing to heavy imports, while Phosphates, more particularly those of high test, continue in request even at the advanced prices demanded by sellers.

Mineral Phosphates—Canadian will come forward in larger volume than ever before, and the higher tests are finding a ready market, 80 per cent. we quote at 1/0 1/2, 75 per cent. 11d., and 70 per cent. 10d. per unit, all with one-fifth of 1d. rise. South Carolina enquired for at 9 1/2d. for U. K., and at a proportionate advance for continent. The higher tests of Somme are very scarce but business is being done in the lower grades. Belgian 40 to 45 per cent., and 45 to 50 per cent. is available, but the higher qualities seem to be all bought up. Cambridge Coprolites selling in small lots at 45/6 f.o.r. Bedfords sold forward.

Bone Ash, Bones and Meal—No sales reported at all, and no demand for bones, though Ash is enquired for and will probably be dearer in harmony with mineral phosphates. Indian bone meal dull at £4 17s. 6d. to £5.

Nitrate of Soda down to £8 5s. per ton and very dull.

Sulphate of Ammonia keeps its position well, to-day's quotation being \$11 17s. 6d. to £12.

Ammonical materials are not effected by nitrate as much as might be expected, the supply of nitrogen from organic matter being so limited.

Dried blood from R. plate sold at Liverpool at 10s. 6d. Fish guano and ground hoofs and horns we are sellers of for prompt and forward.

Muriate of Potash is quoted at £7 4s. 6d. 80 per cent.; Kainit at 23s. 6d. in bulk, 26s. 6d. in bags, and Kieserit at 17s. 3., all f.o.b. Hamburg, subject to open river navigation. Net Cash. Strassfurt weight and sampling.

We have received from Messrs. H. & E. Albert, London, a 4 lb. sample of the Thomas Gilchrist Slag, now largely in use among English agriculturists. A large proportion of the phosphoric acid in this fertilizer is soluble in Citrate of Ammonia, which is considered as valuable as the phosphoric acid soluble in water, in the ordinary superphosphates of lime. The senders inform us that Prof. Johnson of the Connecticut Agricultural Experimental station found in a sample:—19.57% soluble in Ammonium Citrate; 0.30% insoluble. This Fertilizer is sold at 30/6 to 35/ per ton in bags f.o.b., Antwerp or Rotterdam according to quantity, or 35/ per ton Newcastle-on-Tyne according to quantity. An extended reference to this Slag was made in our article "Iron & Phosphates," published in Vol. V., No. 4, June, 1887.

Du Lievre District.

The late showery weather has been much felt in the opencast workings of the phosphate mines on the river, but the shipping of the ore has been regular and satisfactory.

A loaded scow of the High Rock Company was lately sunk off the village landing at Buckingham in deep water; a contract for raising it at \$450 was taken, and a clam dredge has been successfully employed for removing the ore; diving apparatus will now be necessary.

Proprietors of phosphate lots have continued to be in a state of expectation in consequence of the many enquiries for bonds and promises of sale, but few transactions have been terminated. A cash sale of the Angus McMillan Lots at the Little Rapids, Portland, East, was effected on the 19th inst., and this property will, we understand, be put upon the London market immediately. The price paid, we understand, was \$15,000.

The Glasgow Canadian Phosphate Company's property is being negotiated in England by Mr. A. D. Cameron, of Buckingham. The price put upon it by the liquidators is \$25,000.

Mr. George Attwood, the well known English mining expert, was upon the river on the 12th and 13th instants, and visited several phosphate properties in Portland West, accompanied by Mr. Lainson-Wills. We are gratified to see men of Mr. Attwood's experience and ability giving their attention to the development of our local mineral wealth.

Mr. Lainson-Wills retired from the management of the Canadian Phosphate Company on the 18th inst., but continues his residence in Buckingham for the development of an important phosphate enterprise.

In view of the remarks of the *Star* and other English financial papers, further comment upon the failure to float the Emerald, Central Lake and Leve River Phosphate Company is

unnecessary. This is but another striking instance of a fairly good investment being swamped by excessive promotion money, and a strong disposition to overestimate the production and value of the properties for sale.

"It is," concludes the *Star*, "no wish or intention of ours to run amuck at all Canadian phosphate properties. Many of these properties are valuable, and may be purchased at reasonable prices, such as will allow good returns to investors. It is because promoters and others are attempting to foist upon the public worthless properties, or, as in the case of the Emerald, properties which, though good in themselves, are swamped with capital, that we think it necessary, in the interests of the industry itself, to speak the truth about them."

We are informed that it is the intention of the owners to put these properties again on the market, with a Prospectus greatly modified in tone, and with the objectionable features characteristic of its predecessor eliminated.

A small force continues to make satisfactory progress with development work at the Little Rapids mines. A number of eminent experts have recently made a close inspection of the workings, and have returned greatly pleased with the appearance of the pits, and all that has been done of late to improve the plant and property. The Rapids were also visited lately by a number of American capitalists who spent a few days at the mines.

Mr. O. M. Harris, who returned from the mines of the Canadian Phosphate Co. on Saturday, reports that things look very well there. He says: "We have struck a very rich deposit of phosphate in No. 1 pit about 100 yards from the Star-Hill Cobbing House which promises to be very productive after we have got down to a greater depth. Our other pits are all looking fairly well and had it not been for the quantity of rain we have been having all this month our output would have been considerably increased."

Mr. E. W. Ingall, M.E., writes: Mr. James White and party have resumed their Geological and Topographical work in this district. At time of writing the party was heading toward the Templeton region.

Kingston District.

The Foxton mine was opened the first week in May, and with an average of eighteen men has produced 200 tons of 80 per cent. ore. The cost of the same delivered at Kingston not exceeding \$6 per ton. The mine is in a very good condition and has fully carried out the expectations of the owners. The new boiler has just been bricked in, and steam drills and hoists have also been purchased, and we look for a larger output in the near future. The ore is of a fine green quality, fully equal in all respects, to anything produced on the Lievre River.

The Memphremagog Mining Co.—

Mr. Chas. C. Smith and Capt. Warne, president and manager of the Memphremagog Mining company, spent last week in New York, and succeeded in making arrangements for shipping 500 tons of ore to be smelted at Elizabethport, N.J. The ore is being mined at the rate of ten to twenty tons per day, and is composed of copper, sulphur, iron, antimony, zinc, and galena. The surface of the vein exposed is 40 feet deep by 1,000 feet long. From the indications the supply of ore is very large.

MINING NOTES.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

NOTICE.

At the Annual Meeting of the Gold Miners' Association of Nova Scotia, held at Halifax, on 6th March, a resolution was passed adopting the "Canadian Mining Review" as the official organ of this Association. Our readers may therefore rely upon the accuracy of all information published in these columns bearing on the gold mining industry of the Province.

Miscellaneous.

The North Sydney Coal Company, Limited, was registered on the 28th ult., with a capital of £2,800, in £1 shares, to acquire and work coal mines in Nova Scotia. Messrs. W. M. Simpson and F. Roberts are appointed managers both in Canada and Europe, and will be entitled to debit the company with a commission of 5 per cent. on the gross amount of sales and purchases made by them on the company's behalf.

At an adjourned meeting of the Joggins Coal Mining Association held recently, a letter was read from R. G. Leckie, of the Cumberland Coal and Iron Company, of Springhill, stating that he would withdraw the 5 per cent. commission stipulated in his offer, and would allow it to stand at \$200,000 net. After a general discussion, it was decided to adjourn the meeting until the 5th of June, and get in the meantime an expression of opinion from the stockholders on which the meeting might act. The mines, at present, are under lease to the Phoenix Coal Company, and the members of that corporation, many of whom are also shareholders of the Joggins Association, are adverse to the sale, for they are now making money out of the mines, and expect to do still better in the future, as the railroad facilities for shipping will be improved. Should the mines be sold, the Joggins Association will have to pay the present debt and the Phoenix Company for their improvements.

Sherbrooke District.

Matters at Goldenville are very quiet, the only work doing being that of J. H. M. Donald on the old "Mayflower" belt. A force of five or six men are employed all told, and from 200 to 300 tons a month are crushed. The yield is from three dollars to five dollars per ton. Last month gave 29 oz. from 200 tons.

Cochran's Hill.

The work doing here by the English people who have had control of the property for some months past, is very little, some forty feet of shaft and about as much cross-cutting representing development work. It is to be regretted that a more vigorous policy has not been instituted.

Stormont District.

The Palgrave Co. on Hurricane Island are working steadily, and the president of the Co. reports at least one year's reserves ahead. Last month's work produced one hundred and forty-eight ounces from two hundred and eighty tons. Several men were put at surface prospecting the last month but no pay lode has yet been cut.

Messrs. Frazer and Hamilton who were prospecting on Dunn Cove have quit work there, results being discouraging, and now have put their men away to the eastward of the workings of the old Mulgrave vein.

Central Rawdon.

The Northup Lode in this district continues to yield large monthly returns, the product for May being 350 ozs. The lode is believed to be a fissure, as it runs obliquely to the course of the country rock, having a north and south course with an easterly dip. The shaft is down only 130 feet. The mine is situated in the midst of a fine agricultural country.

Waverley.

The Lake View Mining Co. (which is the new name of the old American Hill property) have nearly completed the work of putting in an Ingersoll-Sergeant straight-line air compressor. It will work four 2½" drills. The work of straightening and retimbering the old shaft on No. 6 lode is about completed, the bottom of the shaft having been reached the first week in June. The shaft now measures about 350 feet in depth. Work on the cross-cuts from the bottom of this shaft will commence this month. These cross-cuts (running north and south) are designed to cut the 120 feet of the Taylor belt, and to prospect the eight or ten other lodes known to traverse the belt.

The cross-cut tunnel into Laidlaw's Hill in East Waverley is still driving, but with only two men. The breast of tunnel is now in over 300 feet, but so far no lodes of value have been cut. The object of the tunnel is to cut the rich "Barrel" lode worked some twenty years ago on the surface, some 200 feet or more below the old workings. This work is being done ostensibly by English capital.

An attempt is being made to open up the old De Wolfe property in West Waverley, now owned by Mr. Palgrave of London, G.B. Some of the old machinery has been patched up and will be used to pump out the Tudor and Union lodes which have been flooded and abandoned for twenty years. The machinery, both of mine and mill, is of heavy English pattern and entirely unsuited to the economical working of any mine, much less a low grade gold deposit. It is to be regretted that any attempt to utilize such machinery should be made.

Quebec.

The Asbestos industry continues to rapidly increase in importance, and at all the mines operations are going ahead briskly. It is thought, from present indications, that the output of this mineral from the various districts will be largely in excess of former years. The demand for the product continues strong, and many manufacturers, being unable to obtain their supply of *First*s, have to be content with *Second* and *Third* qualities.

At the Bell's Company mines the new machinery is working smoothly and gives entire satisfaction to the management. It is confidently anticipated that the year's output will not be far short of 2,000 tons, the greater proportion of which will be No. 1 quality.

The Johnston Company continue to produce large quantities of *First*s, and your correspondent estimates that the profits of this concern will figure close upon \$50,000 on this season's operations.

The excellent property owned and operated by the King Bros. looks as well, if not better, than ever. The ore prepared for the market by this firm is exceptionally well cleaned and cobbled, and being of very fine quality, is eagerly sought after by manufacturers. Openings are being made on two new mines on Lot 28 in the 5th Range of Thetford and on Lots 24 and 25 in the 1st Range of Ireland. These give promise of good returns to the owners.

The Wertheims have 125 men working on 15 pits, producing large quantities, which is being shipped to their factory at Frankfort, Germany. The work is done by contract, the mineral being cleaned, cobbled and bagged at something like \$25 per ton, and as the market value of the stuff averages \$75 per ton, it is easy to calculate the profits yielded by this concern. We understand that Mr. Wertheim is now in negotiation with Dr. Reed, from whom the present productive property was acquired, for the purchase of three other lots, 27, 28 and 29 in Range A, Coleraine. Messrs. Copeland and Bacon, New York, are equipping these mines with a full complement of working machinery. This will be in full running order within the next ten days, and it is estimated will make a saving in the cost of production of something like ten dollars to the ton.

An important discovery is reported to have been made on Lot 31, Range A, Coleraine, about a quarter of a mile from the Johnston mine. This property is owned by Messrs. Lake & Mitchell, Sherbrooke, and R. H. Martin, of the Chalmers-Spence Company, of New York. The veins are of good size and excellent quality, and being located in the immediate vicinity of the Quebec Central Railway, the property offers every facility for economical and profitable working.

A good vein has been opened on the property of R. H. Lambly, near the line of Garthby.

M. C. Lionais has, we are informed, been unsuccessful in his Suit against the Frechette D'Auville Company. This company's mines are being worked profitably. By the way, Mr. Lionais seems to be in no hurry with his Suit against the REVIEW.

At the adjourned meeting of creditors of the Scottish Canadian Asbestos Company, before Mr. Justice Billy, Mr. R. C. Smith, representing the American shareholders, moved to dissolve the meeting and set aside all the proceeds in liquidation, on the ground that the company being incorporated under the Imperial Joint Stock Company's Act, the Canadian winding up act did not apply to it. He also moved for a delay to examine into the affairs of the company in Scotland. Mr. W. White, of Sherbrooke, opposed the application on behalf of the Scotch preference shareholders and pressed for the immediate appointment of a liquidator.

The nature of the judgment given by Mr. Justice Billy in this case at Arthabaskaville was simply the appointment of liquidators (Messrs. Hanson Bros., Montreal). There was a motion made on behalf of Mr. Harry Allan, of New York, one of the ordinary shareholders of the company to quash all the liquidation proceedings on the ground that the winding up act in Canada does not apply to companies incorporated under Imperial charter, and that Dominion legislation intended to extend the operations of the winding-up act to Imperial com-

panies is *ultra vires*. The motion to quash was rejected; but, we understand that Mr. Allan is about to make application for leave to appeal to the Court of Queen's Bench on this single ground.

We understand that Messrs. Lomer Rohr & Co. have shipped from Montreal 80 tons of Feldspar per S.S. Zambesi, to Liverpool. This we presume is another shipment from the Villeneuve mica mines for the manufacture of pottery and china ware.

Six thousand and three shares of the Lake Huron Silver and Copper Mining company, standing in the name of the late Francis Hincks, forfeited for non payment of a call of 5 cents per share, will be sold at the company's office at Montreal on the 15th July.

Ontario.

Canada has not been able to make much of its mineral oil deposits, owing to the presence of sulphur in the oil, which caused a disagreeable smell, and fouled the lamps when burning. A means has now, says the *Financial News*, been discovered of removing the sulphur so that the Dominion will no longer require to import great quantities of oil every year from the States, and may even begin to export on its own account.

We have received some excellent samples of galena from the Caldwell mine near Lanark. An assay by Mr. J. T. Donald, Montreal, gives silver 4 ozs. 1 dwt. 16 drams per ton, 2,000 lbs. Mr. Caldwell has a hoisting engine and a couple of pumps, and everything in shape to sink the shaft, but owing to the recent heavy rains the work has been greatly retarded.

Regarding the remarkable gas well at Kingsville, a gentleman who recently visited it, says that the company, in their boring, struck a sulphur spring at the depth of 400 feet. Continuing about 1,100 feet from the surface they struck gas, and concluded to go deeper. A few feet lower down another pocket was found, and so strong was the pressure that the drill was forced up out of the shaft by it. "When I saw the well they had cased it in with a four-inch iron pipe, which was laid along the earth about fifty feet from the top of the well, and turned up at the end like an ordinary gas-pipe. I was there when it was first lit, and the noise made by the rush of the gas was like a railway express, or the roar of Niagara at a distance. The gas, which has a strong smell of sulphur, shot up for about two feet out of the end of the pipe in a solid mass. Then it became flame that reached to the tops of the trees in the neighbourhood. It was a most wonderful sight. The pressure is estimated at 500 pounds to the inch, or close upon 11,000,000 feet per day. Experts say it is one of the five largest wells ever discovered. The projectors are boring a second well, and a company will be organized at once to take the matter in hand. Since this well was struck, capitalists have visited it with a view to investment. A site has been secured, and a company with \$200,000 capital will build a glass factory, employing 100 hands."

Sudbury District.

Correspondence to the *Toronto Mail* states:—The smelting works of the Canadian Copper Company, which have been working without interruption since last December, are treating about 125 tons of ore daily. A second blast furnace of the Herreshoff patent is now being set up, and will be in running order about the

first of August. The company has just effected an arrangement with the Dominion Government whereby such mining and smelting machinery as is not manufactured in Canada may be admitted free of duty, and three carloads of machinery arrived here yesterday under this arrangement. Other orders, which will be filled in a short time, will enable the company to erect eight furnaces, with a total smelting capacity of 1,000 tons of ore daily.

The duty on coke has hitherto checked the smelting enterprise here, but it is understood that the Government have agreed to place all coke required for smelting purposes on the free list by Order-In-Council. It is also understood that proposals have been made to the Dominion and Ontario Governments for the extension of the Central Ontario railway from Coe Hill to Sudbury, on the condition of a grant of \$3,200 per mile from each Government, and that if a satisfactory understanding is arrived at the work of construction will begin at once. The principal stockholders of the Central Ontario Company are also stockholders in the Canadian Copper Company, and they represent that at the present time they can command any reasonable amount of capital for their enterprises. Messrs. Ritchie and Cornell, while in Toronto, authorized the statement that in connection with the extension of the railway northward they will erect a furnace in Hastings county for the manufacture of coke iron, with a capacity of 250 tons daily. They propose to utilize the new Edison patent for desulphurizing magnetic ores, which is claimed to be at once a cheap and a perfect process.

The annual meeting of the Vermillion Mining Co. was held at Sudbury on the 5th inst., when the following officers were elected: B. E. Charlton, Esq., of Hamilton, Pres.; A. G. Duncan, Esq., of Marksville, vice-president; John Oliver, Esq., of Chicago, sec'y-treas.; Board of Directors: Messrs. V. W. Foster, W. D. Hitchcock, E. H. Reid, H. A. Christie and W. S. Miller, all of Chicago, Ill. A carload of ore was shipped from the mine three weeks ago, which assayed 14 per cent. of copper, 11½ ounces of silver and 2½ ounces of platinum to the ton, which is an excellent showing for that quantity of ore. It was sold to a company with reduction works in Chicago.

The Copper Cliff company at Sudbury have just sold 600 tons of nickel, and two more smelters are to be introduced. The Stoby mine is being opened, and operations are being pushed in the township of Dennison by the Dominion Mining company.

Port Arthur District.

The President of the Board of Trade, Port Arthur, in his last Annual Report makes the following appropriate reference to the present methods of purchasing mining lands in that district:

"Mining appears always in Canada to be considered an illegitimate business. Men may speculate in telegraph stocks, which really neither increase nor decrease in value; they may gamble in bank stocks, which seldom vary in dividends they pay; they may boom real estate to such an extent that a city of 150,000 or 175,000 inhabitants has land enough laid out in 'additions' to hold a million people, and which cannot possibly have any other than a speculative value for a generation; they may take a Chicago wheat corner or pork corner, in which they invariably pay for their experience; they may do

a hundred other things of the same character, but these they consider safe or paying investments or speculations as the case may be. But ask them to buy mining lands at two dollars per acre, and invest the most modest sum, not in mining, but in seeing what their lands contain, and what is their answer? If they have courage enough to buy the land they will neither sell at a reasonable price nor show their faith by working. What is the result? To day every working mine in this district is being opened by either English or American companies, and 75 per cent. of the recent sales of Government lands are made to either American or English investors. Is it much wonder that Americans say that we do not appreciate the richness and value of the great mineral district tributary to our town."

Prospecting and taking up iron lands appears to be the chief object of mining men during the past month, the Red Hematite from Nipigon attracting especial attention.

Badger Mine.—They are still shipping high grade ore from here and the Mill is now operating on the rest. The specimens from this mine presented to the Board of Trade are the richest ever seen in the district.

Silver Mountain.—The East End "Shuniah Weachu" is daily barreling some high grade ore for shipment to England.

The West End mine continues the same encouraging development. All the shafts and tunnels are showing up very fine ore. The management are preparing to build a good wagon road from the mine to Whitfish Lake, about 2½ miles.

There is nothing special to report concerning the other working mines which are swinging along as steadily as ever, awaiting railway facilities for which the bonus by-laws are now before the people with every assurance of being carried by a large majority.

A couple of silver lead properties east of Port Arthur are to be developed by some American capitalists. The Ogema is a specially promising property. A road is now being cut to it and a tunnel some 75 feet in length to strike the vein at a depth of 60 feet down will be driven under the direction of Captain Parsons.

Three of the staff of the Geological survey are now doing the district west of Port Arthur in a thorough manner.

Nickel and asbestos have recently been found near Port Arthur and a most successful explorer is now out searching for tin. He is certain he has met with a substance very similar to the tin ore recently shown him.

Government money and fine weather have rendered the roads to the mines excellent travelling.

Bush fires are raging around Whitefish and Arrow Lakes. Bad for the timber but good for explorers.

British Columbia.

Application for incorporation is made by the following companies: The Willow River Gold Mining Co. (Lt.) capital \$25,000; the Alpha Milling and Mining Co. (Ltd.), capital \$120,060, to acquire and work lands at Anderson Lake;

the Donald Gold Mining Company (Ltd.), capital \$10,000, to work mining lands in Kootenay district; the Salt Spring Island Mining Company (Ltd.), capital \$40,000, to acquire and work mining lands on Salt Spring Island.

General Mining.—Accounts to December 31 submitted in April, but an interim meeting is held in November. Dividend for 1884, 5 per cent; for 1885 and 1886, 3½ each year; and for 1887, £4 13s. 9d. per cent. Reserve fund, £29,850.

Low Point.—The vendors' shares, up to the end of 1888, do not rank for dividend until 7 per cent. per annum dividends have been paid on ordinary. Accounts to Dec. 31. For 1887, 5 per cent. was paid on the ordinary shares other than those held by the General Mining Assoc., that Company foregoing their dividend rights.

North Western Coal.—The deferred shares receive on dividend until 15 per cent. per annum (cumulative) has been paid on the ordinary. Accounts to June 30. Dividend for 1887-8, 5 per cent.

Sydney and Louisburg Coal.—Accounts to Dec. 31 submitted about May. Out of the profits of 1884 one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,574.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200. Reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £450,000; purchase consideration, £400,000, in cash or shares. Fully-paid shares issued to the vendor; partly paid to the public.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital of £100,000, of which £80,000 was the first issue. Most of the shares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1885. Accounts to October 31 submitted in March. No dividend yet. Debentures, £34,450. Reports are not obtainable, but this information is official.

Anglo-Canadian Phosphate.—The preference shares rank first for 7 per cent., and after a like rate has been paid on the deferred shares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £2,576, which was carried forward.

White's Asbestos.—Registered April 9th, 1889. the authorised capital is £100,000; first issue, £60,000, of which £20,000, fully paid, was issued to the vendor.

Coal Mining in the North-West.

The Lethbridge Colliery—the property of the North Western Coal and Navigation Company, Limited—producing that coal known throughout Manitoba and the North-West Territories as "Galt coal" has been in operation since 1882; though its development properly speaking, only dates from the autumn of 1885, upon the completion of a narrow gauge railway—owned and operated by the same company—from the C. P. Railway at Dunmore, near Medicine Hat, to Lethbridge, a distance of 109½ miles. This company owes its existence to the exertions of Sir Alexander T. Galt, G.C.M.G., who with other gentlemen in 1881 secured coal leases in Alberta, on both the Bow and Belly Rivers. The year following, these leases were thoroughly examined, and from the reports received it was decided to open a mine on the east bank of Belly River, being the site of the present town of Lethbridge.

Early in 1883 the Northwestern Coal and Navigation Company, limited, with a capital of £50,000 sterling was formed for this purpose, and during that and the following year about 3,000 tons were shipped by way of the Belly and South Saskatchewan Rivers to Medicine Hat, and then tested on the locomotives of the C. P. Railway.

These tests proved the value of this coal as a steam producer, but owing to the very short and uncertain season of river navigation it became necessary to abandon this mode of transfer and build the Narrow Gauge Railway above referred to. To do this, the company increased their capital to £150,000 sterling, and bonded the road to the extent of £160,000 sterling, which was formerly opened by the Marquis of Lansdownie, then Governor-General of Canada, on the 24th September, 1885.

Prior to any of the mining operations above mentioned, coal was extracted on the west bank of Belly river opposite the present Lethbridge Colliery, by the late Nicholas Sheran, who probably was the first coal operator in Northwestern Canada.

Mr. Sheran early in the seventies located at the St. Mary's River, about 6 miles south of Lethbridge.

This point being near the St. Mary's crossing of the Benton-Macleod trail, the freighters on their return trip to Benton used to load their "string teams" with coal and sell it on their arrival in Benton.

In 1879 Mr. Sheran moved down the Belly River and located on the west side of the river, as already stated, where the lower trail crossed leading from Macleod to Benton. Here he occupied himself in conducting a ferry during high water, also in mining coal which he sold at \$5 per ton to the freighters who afterwards retailed it in Benton at \$20.

Returning to the operations of the Northwestern Coal and Navigation Company, the output of their colliery since 1885, has yearly increased, even far beyond the expectations of the promoters of the scheme.

The principal consumer of their coal is and has been the C. P. Railway, and *en passant*, it may be said that the success and advancement of the North-West, is, in a great measure, dependent upon the success of this Corporation, and be it said to their credit, even in the absence of competition, they are without doubt most liberal, far surpassing in the writers opinion any of the transcontinental roads to the south of the 49th° parallel.

Owing to the very large and increasing demand for coal in the smelting and reducing

ASBESTOS.

THEO. HAMEL,
44 Mountain Hill, Quebec,

SOLE ASBESTOS MANUFACTURER in CANADA

Write for prices and catalogue. Use Asbestos and save your money. Applied on boilers and Steam pipes it will prevent them from rusting and will economize 33% on fuel.

works in Montana—the State adjoining Alberta on the south—the N. W. C. & N. Co. have for some time past, been moving in the direction of placing their coal on this market.

In the summer of 1888, several car loads were shipped by way of the C.P.R., St. P.M. & M., N.P.R.R. to various smelters in Montana for the purpose of being tested. The result being favourable, negotiations are now in progress for the construction of a railway from Lethbridge to Helena, Montana.

The completion of this road will probably increase the present output about 500 per cent., in which event Lethbridge will be quite a busy centre of trade, where a few years ago, prior to the construction of the Canadian Pacific Railway nothing but desolation reigned.

The Empress Mill, Renfrew District, N. S.*

By J. E. Hardman, M. E. Oldham.

Probably in no other country where gold mining has been carried on for nearly thirty years has so little advance in methods of milling been made as right here in Nova Scotia.

It is doubtless owing to this fact that so much general interest has been shown in the ten stamp mill recently erected for Mr. C. H. North, at Renfrew.

The mill which I am about to describe in detail, is essentially and in all important points, the mill which has been in use in the Black Hills of Dakota for some years.

Mr. D. S. Turnbull, the superintendant of the Empress Mine, and under whose supervision the mill was built, has had an extensive experience at the Homestake and other Dakota mines.

On the 1st of February, 1889, there were 685 stamps running in the Black Hills. Of this number, 580 were essentially of the one type or pattern, known as the "Homestake," 25 in the "Cassel" mill were of older pattern, and 80 in the "Caledonia" mill were of a distinctly different type. The largest number of stamps in any one mill in the Hills is 120: the largest number owned by any one company is 200, by the Homestake; but as the larger part of the shares in each of the five large companies now operating is held by the same individuals, the same policy prevails throughout nearly all of the mills.

Of the 685 heads, 320 are located at Lead City, 240 at Terraville and 125 at Central City.

These mills were all built in 1878, 1879 and 1880 (with the exception of the last 20 head in the Caledonia, which were added this year), so that this particular type is no experiment, since it has been in use from eight to ten years. During this time minor changes have, of course, been made, but the pattern as a whole has not been changed.

I have drawn your attention to these figures and facts, as perhaps, a necessary introduction to the subject of this paper.

THE BUILDING AND ORE BINS.

The Empress Mill covers a ground space of forty feet square; of this, a portion covering sixteen by forty feet is devoted to ore bins and rock breaker, the remaining twenty-six by forty feet includes the mill proper. The building was designed for twenty stamps, but only ten have yet been erected; I am told the other ten will be added this year.

The posts of that portion devoted to ore bins are forty feet in height; the other portion is built with a shed roof, and the general arrangement of the building can be seen from the accompanying photograph.

There is nothing especially novel in the framing of the building itself, but perhaps one feature

may be of interest to the members, viz.: the battery blocks were built in place before any portion of the building was erected, and the battery sills are the sills of the ore bins; this method ties together the battery frames and ore bins, and by the other parts of the frame of the bins, ties to the building. The method has the great feature of economy, but also has the objection that if the ore bins are not full, the frame of the building is more or less in vibration; with the bins full, the bracing is rigid and the method very satisfactory.

The battery blocks are built of selected white hemlock plank, six inches and twelve inches wide, spiked together, and so placed as to break joints. The planks are of two lengths, ten and fourteen feet, respectively, the fourteen feet plank forming the block proper, and the ten feet plank forming the connection between the longer planks, thus practically making one solid block of plank on end, thirty inches wide by twenty-seven feet long, and ten feet in depth below mud-sills. The accompanying sketch will illustrate the idea.

These blocks are fastened with binders in the usual way, bolted together with transverse rods, the upper binder being on a level with the top of the mortar block, and the lower one three feet below. The mortars are fastened to these blocks in the usual manner, each mortar having eight one and a half inch bolts, five and one-half feet in length.

Parallel to the mortar blocks, and thirty feet in length, are four mud-sills, two on each side, spaced four feet from centre to centre; the top surface being on a level with the ten foot timber in the mortar block. These sills are sixteen inches thick and eighteen inches wide. On right lines of these mud-sills are placed six cross or battery sills, each twelve inches by fourteen inches, spaced five feet seven inches apart, centre to centre. Where these battery-sills cross the mud-sills and the battery-blocks, a cut two inches deep is taken out, thus locking the sills and bringing the cross-sills solidly on the mortar-blocks. Upon these battery-sills are erected the battery-posts, twelve inches by fourteen inches, which carry the cam-shaft and guide timbers. Upon these sills also are mortised the posts, sixteen inches square, of the ore-bins, and the diagonal braces of the bins are also tied to these sills. These posts run up and connect with the frame of the building, and the horizontal beams of the bins are also mortised into these posts. On these beams comes the weight of the ore, also the strain due to the rock-breaker and to the tram car.

It will thus be seen how almost every part of the inside and outside framing is braced to and dependent on the battery sills, which are securely locked to the battery-blocks and mud-sills. The economy alluded to on page 3 is now apparent. No heavy foundation other than the one for the batteries is necessary.

The ore-bins are triangular in section, with the vertical side towards the battery; they reach to the cam floor and end in a chute which conveys to the self feeder. The two sides of the right angle are sixteen feet in length, and the capacity of the bins is about two hundred tons.

To the upright posts of these bins on the vertical side, the battery frames are braced by means of two short horizontal struts, and tie bolts, one above the cams, near the top of the battery post, and the other forming the beam for the cam floor. These struts are mortised into both battery posts and ore-bin posts. This method of bracing leaves the entire front of the battery clear, and gives the maximum amount of light on the plates.

The line-shaft of the mill lies directly on the battery-sills back of the mortars, and beneath the feeding floor. To this arrangement many exceptions may be taken, necessitating as it does, short and nearly vertical belts to the cam-shaft pulleys, and the consequent use of tighteners, to say nothing of the constant drip from floor above, and the attendant darkness, but the purpose of this paper is not to criticise, only to describe.

THE BATTERIES.

The drawings accompanying this paper are of the Homestake mortars, the Empress mortars being precisely like these drawings with one unimportant exception, namely, that the discharge opening has been lowered relatively four inches as shown by the red ink line in fig 3. That is to say, Mr. Turnbull being somewhat influenced by the prevailing notions in the province regarding high discharge batteries, yielded so far to the current prejudice as to put four inches more in the bottom of his mortar, thus decreasing the height of discharge that amount. I am informed by him, that, after two months experience with the same, his next batteries will not be modified, but will be made exact copies of these drawings.

The drawings are self explanatory and need no letter press.

The features of importance are:—

(1). The inside dimensions of lower part of mortar: that is the sides and ends are drawn in towards the die, leaving a space of only one inch on the ends, and two inches on the back from the face of shoe or die. This conduces to rapid crushing by tending to throw the pulp directly under the shoe.

(2). The so-called "Graham" chuck-block which is removable, and can be replaced with one smaller. The first one used is seven inches high, but when the die has worn down two inches, the seven inch chuck-block is removed and replaced by one five inches wide, which lasts for another two inches wear, when the die is usually thrown out and a new one put in. This chuck-block makes a high discharge mortar, and facilitates amalgamation in the battery. With the Homestake having the discharge eight and three-quarter inches above bottom of mortar and adding seven and one-quarter inches of chuck-block makes a mortar sixteen inches deep. In the Empress four inches of this have been removed and the mortar is between eleven and twelve inches deep.

While speaking of this chuck-block I may say that Mr. Turnbull has substituted a piece of six inch channel iron for the wood of Mr. Graham, with excellent results.

As shown in the drawing, there is only one inside copper plate fastened right on the chuck-block, this plate is three-sixteenths of an inch thick.

It is claimed that 55 per cent. of the free gold is caught by this plate. The Empress mill has no plate on the back or feed side.

As will be seen from fig 1, the feed opening does not extend the whole length of mortar, but is only twenty-four inches long.

The Empress mortar weighs 6500 pounds. The stems are of wrought iron three and one-quarter inches diameter, turned full length; they are twelve feet six inches long and weigh 356 pounds each.

The tappets are the two gibbed, double-faced pattern, twelve inches long, nine inches diameter at face, and six inches diameter in the middle; each weighs 132 pounds. The head or boss is nineteen inches long, eight and one-half inches diameter, and weighs 235 pounds. It has no rings shrunk on, but is all cast-iron.

The new shoe is eight and one-half inches diameter, and eight inches high, and weighs 135 pounds.

The total weight of each stamp is therefore 878 pounds; this statement will perhaps surprise some members present who have been told that the stamps weighed 925 pounds, but I desire to say that these figures were given me by actual weighings of the different parts, and may be taken as correct. Moreover, they correspond with the weights given by the Homestake Co., viz.: stem 340 pounds, tappet 140, head 240, shoe 130, total 850 pounds.

The cams are double armed and each arm is 17 inches long from centre of hub. The weight is 236 pounds. The short arm has a beautiful curve, and the stem is raised without the slightest perceptible jar to the tappet.

The cam shaft is fourteen feet long and five inches diameter, it runs in babbitted iron boxes, and weighs 930 pounds.

The Die is eight and one half inches diameter and weighs 93 pounds.

The cams are lubricated with molasses, forming a smooth surface which does not so readily catch grit, and which revolves the stem in about three drops. The order in which the stamps drop is 1, 3, 5, 2, 4.

The guides in the Empress Mill present a new feature which I consider admirable, and worthy of adoption by us all. Instead of the usual two pieces of hardwood scored with five grooves across the grain, each stamp has its own guide block. These blocks are two pieces of hardwood about sixteen inches long, (with the grain), and eleven inches wide and three to four inches thick. The groove is cut in these blocks *with the grain*, each half block being made from a template which serves for the whole mill, and is bored for two seven-eighths inch bolts; which fasten the two halves solidly to the guide timbers. Thus each stamp has its own guide, which can be replaced by merely removing two bolts, without disturbing the guides of the other four stamps in the battery.

The Empress Mill uses twenty mesh twilled wire screens, and this is undoubtedly one reason for an increased capacity. The screens measure forty-eight inches by thirteen inches. But the difference between wire cloth screens and slotted screens is not by itself sufficient to account for the increased capacity of the mill, the other features are fully as important factors.

The outside plates are those taken from the old mill, and at present each battery has one four feet square plate, followed by a plate narrowing down to twenty-four inches at the bottom, and about three feet in length. This arrangement of plates is but temporary, Mr. Turnbull contemplating some marked changes.

The quartz coming from the mine is trammed directly into the top of the mill, and dumped about four feet to the breaker floor. No grizzlies are used. The quartz is fed by hand to an old pattern Blake crusher, which is entirely unfit for the work. It is proposed to substitute a small-size Gates crusher. The ore falls from the rock breaker into the ore bins, and thence runs down a chute to the automatic feeders. These machines are the "F. B. Hammond" patent feeder, and detailed information concerning them is not accessible. They are exceedingly simple in construction and appear to me to be by all odds, the most efficient feeder I have seen. I understand that the Truro Foundry Co. have the sole right to manufacture the same, but of this I am not positive.

THE MOTIVE POWER.

The power to drive this mill is furnished by a brook, which appears to have a flow of about

2,000 cubic feet per minute. The old mill was driven by an 18 foot overshot wheel, but Mr. Turnbull, by cutting a ditch along the hill-side some 300 feet or more long, has increased the head to 34 feet. The water-wheel is a turbine on a horizontal shaft, called the "Perfection," and made by Paxton, Tate & Co., of Port Perry, Ont. It is 27 inches in diameter, and is enclosed in an iron scroll case. The wheel is located back of the mill, on a separate foundation, and has a head direct of 20 feet, with a draught tube 14 feet in length.

The gate was only one-quarter open at the time of my inspection, and the power was ample, but, owing to the fluctuation of speed caused by the old-fashioned breaker, a governor would seem to be necessary. I understand that it is the intention to put a governor on the wheel this summer.

A pulley on the wheel shaft transmits the power directly to the line-shaft of the mill, by means of a six-ply rubber belt.

The water for the batteries is taken from the iron penstock above the wheel by a four-inch pipe, and distributed to the stamps by half-inch pipe nipples leading to each stamp. No arrangements have yet been made for heating either water or building in winter.

At the time of my visit, the 27th of May, the stamps were dropping sixty times per minute, and had seven and one-half inches' drop. Mr. Turnbull informed me that he was crushing one and one-quarter tons per stamp per shift of ten hours, at that speed. It is his intention to run at 80 to 85 drops per minute, when the new Gates crusher is in, and the supply of ore from the mine warrants it.

I have no hesitation in expressing my opinion in regard to the mill and its capacity. It seems to me to be the mill which all Nova Scotia gold miners can study and copy to advantage. It is the best built mill I have seen in the Province, both as respects iron work and wood work. I believe it can easily crush 25 tons of our Nova Scotia quartz in 24 hours. As to its capacity for saving gold, it has yet to be tested. But the runs already made have caused Mr. Turnbull to state that he is getting four dollars per ton *more* than he got out of the same quartz with the old mill.

It is still an incomplete mill in the fact that it has no provision for concentrating and saving the sulphurets in the ore. I am told that Renfrew concentrates assay only twenty dollars per ton, if that is the case, it is perhaps better economy not to attempt to save them. But a new type of the Hooper concentrator is to be supplied to this mill this month, and definite information can then be obtained.

This subject of concentrates and concentrating is one I am deeply interested in, and I hope at no remote date to have the pleasure of reading a paper on that subject before this Association.

In conclusion I would advise every member who has a mill to build, to first visit Renfrew before he makes any plans, or lets any contracts.

*Read before the Gold Miner's Association, June 3, 1889.

Pennsylvania Miners' Wages.—From official returns received by the chief of the Bureau of Statistics of Pennsylvania, the wages of 20,000 miners employed at 130 collieries have been ascertained. The wages of the best paid miners amount over \$700 a year, and the lowest to \$200. The average in the anthracite and bituminous regions will be about \$500. A considerably lower figure is said to be earned in the bituminous.

MANUFACTURING NOTES.

New Works of the Dodge Wood Split Pulley Co., at West Toronto Junction.

We take much pleasure in giving special mention and a partial description of the above enterprising company's new works which have lately been erected at West Toronto Junction. The site selected is on the north side of the C. P. R. track, covering an area of some 4½ acres, which gives every facility for the shipping and receiving of stock, having special sidings for that purpose. The works, consisting of main building, 250x54, three stories, with annex 80x60, large store house, machine and blacksmith shops, &c., all of solid brick, having been erected especially for the manufacture of the Wood Split Pulley, and are completely equipped in the most modern and substantial manner.

Entering the annex we find the engine room, a model of completeness in itself, and are at once attracted by a beautiful and practical illustration of the transmission of power by manilla ropes, a system now very popular in the United States and Great Britain, and being largely adopted in this country through the efforts of this company who make that their specialty. The power is taken from the 13ft. grooved fly wheel of a handsome 100 H. P. compound engine, and conveyed to the 250 feet of main line shafting by means of 11 wraps of 5 rope running on to a 63 grooved pulley, which with the lighter pulley on travelling carriage and necessary idler and winder, constitute the main drive which runs the shaft at 300 revolutions per minute and drives all the machinery in the factory. In addition to the main drive there is a second transmission from engine shaft upright to counter shaft, from which is driven the mammoth Sturtevant fan. This fan, with the heater attachment, supplies all the hot air necessary for the heating and ventilation of the whole factory and dry kilns. It discharges 82,000 cubic feet of air per minute at 250 revolutions per minute, and requires 18 H. P. to drive it. The boiler is a "Field Stirling" water tube safety boiler, having a working pressure of 165 lbs. and 125 H. P. capacity. In this building we also find the dry house, which holds 60 M. feet of lumber, all on trucks of 4 M. feet each, and arranged so that as soon as a truck is passed out for use, a fresh one is pushed in from the other end, thereby keeping the kiln constantly full. The loaded truck of dried lumber is carried on an auxiliary car into west end of main building and deposited close to the large endless bed surface Planer and planed, then passed to the cutting up saws. We have now passed from annex into main building and are shown the direction in which the lumber travels after leaving the Planer. We find that all arm and bushing stock courses down one side of the large ground floor while the rim stock goes down the other side. In this way the work is systematically classified, each man and machine having his special portion of the pulley work to do. The pulley as it now appears, has reached the last end of first floor, and is taken on elevator to next floor, where it commences to travel westwards, passing through the different stages it arrives at west end of second floor, when we

find it a "Dodge Wood Split Pulley," ready for the paint shop. It is now taken in on Elevator (at that end for the purpose) to paint shop on 3rd floor, where it is thoroughly filled with a patent specially prepared filler, painted and varnished, and afterwards wrapped with special wood wrappers, size marked on end and is ready for shipment.

The machine shop is completely equipped for all iron work necessary in the making of iron centre grooved pulleys for rope transmissions, turning, shafting, bolt and nut cutting, tapping, smithing, etc.

The dust arrester and shaving service, which works most effectually, depositing into the vault in boiler room, is also worked with a Star-tant Fan.

The works throughout have been constructed with a view to being considered "Standard" by the Fire Insurance companies, all elevators and stairways being bricked in from ground to roof, and all doors iron covered. Each flat is provided with two fire plugs and 100 feet of 2 in. hose, also 3 bbls. and 20 pails kept constantly filled with salt water.

business, will be allowed thirty days trial and to return at the company's expense if then not found satisfactory."

The entire construction and fitting up of this model establishment has been under the direct supervision of Mr. Samuel May, the President and Manager, to whom too much praise cannot be given for his untiring zeal in placing his company in a position to supply the power users of Canada with an article which has long been so universally popular on the other side of the line.

Correspondence and orders should be directed to the office of the Dodge Wood Split Pulley Co., 89 and 111 Adelaide St., West, Toronto.

The Improved Davidson Mining Pump.

The Davidson Steam Pump for mining purposes has become a prime favorite. Simplicity, durability and efficiency are its prominent features, and recommend it for use wherever a thoroughly reliable pump is needed. Only the

repairs. The manufacturers claim that the valve will not get out of order, become deranged or wear out within the life of the pump. The valve is oscillated by an oblique cam, connected with the valve by a steel pin which passes through the valve into the exhaust port, in which the cam is placed.

The moving of the valve does not depend entirely upon the steam admitted to the end of the valve piston, for should that not be quick enough to operate on it with the pump under a high rate of speed, the cam is so constructed that it will carry the valve mechanically, and thus prevent the piston from striking the cylinder heads in any case. This is one of the most important features of the pump, the valve being as much under the control of the piston rod as the valve of the ordinary steam engine, worked by an eccentric, instead of being controlled by an auxiliary valve. Those of our readers requiring power pumps for mining purposes will do well to write for further particulars regarding the Davidson Improved Mining Pump. Address the makers; Davidson Steam Pump Co., 77 Liberty Street, N.Y., U.S.A.

Important to Iron Founders.

A new and important invention whereby Iron Founders can, without alteration of plant or, in fact, any departure from their present methods of moulding and pouring of the heated metal, secure a casting with a wrought iron or semi steel exterior. Besides not only a clean casting is secured, but one of a bright surface is given. The inventor, Mr. F. D. Taylor, M. E. of Brockville, Ont., after many years' experience, has, it is said, succeeded in accomplishing the above objects. It is known that in past years great strides have been made in improving and reducing the costs of both wrought iron and steel. But whilst these improvements have been going on little or no improvements of any note have been made in the foundry beyond that of running the iron into the ordinary sand and chill moulds. Mr. Taylor has invented a cheap lining which can be fitted into any mould and which, so soon as the molten iron comes in contact with it (during the process of pouring) reduces the carbon in the iron to its minimum, thereby producing a casting of increased strength and superior finish.

COAL MINING IN NOVA SCOTIA.

[Continued from May issue.]

By E. Gilpin, Jr., A.M., F.G.S., F.R.S.C., etc., Deputy Commissioner and Inspector of Mines for Nova Scotia.

At the head of the balance is placed a drum, having a powerful brake, and two ropes leading leading to the ballast tub and platform. The former being at the top of the balance, and the platform standing in a gap in the level railway or in a siding from it, a continuous track is obtained by the rails referred to on the platform. An empty tub being pushed on the platform it is evident that the road becomes self-acting, for the tub, at the top of the balance, on being loaded with ballast, will by its weight draw up the empty tub and platform. The platform can be arrested by means of the brake opposite the mouth of any of the bords which are driven similarly to those already referred to. There being a section of track in the bord, the empty tub is landed and replaced by one filled with coal. This additional weight causes the platform to descend and draw up the ballast box which is ready for another tub.

The pillar above the level is left 50 feet thick, and the bords start from the balance and run level for about 150 yards to the next balance. They are 15 to 18 feet wide, and 12 to 15 feet

THE IMPROVED DAVIDSON MINING PUMP.

The company holds eleven Canadian Patents, and the factory has a capacity of about two hundred pulleys per day without working overtime.

The article itself many of our readers have no doubt had an opportunity to try and benefit by the practical use of the Dodge Independence Wood Split Pulley, now a password in almost every factory and mill in the country. To those who have not used them we say get the company's special guarantee, which reads as follows:

"Every Pulley made shall be in every respect as represented. The maple face pulley in every case to transmit from 25 to 60 per cent more power with the same belt than any other iron pulley made with the like tension of belt. The compression fastening guaranteed to be perfect, the compression of wood and iron guaranteed to hold stronger than set screws in any case and to be the most perfect fastening ever invented. To summarize: Satisfaction entire guaranteed. Any Pulley found defective and not as represented may be returned at the expense of the company. Any party skeptical as to the merits of the Dodge Wood Split Pulley, and who means

best quality of material is used in its construction and the workmanship is admirable. In general appearance, as may be seen by engraving on this page, this pump is solid and substantial, simple and pleasing in design. Unlike other direct acting pumps, it has only one valve in the steam chest. This, which may properly be called a compound slide-valve with cylindrical face, performs two duties, that of the ordinary slide-valve and of the auxiliary valve combined. Its duty as a slide-valve is, of course, to reciprocate across the steam ports, to admit steam alternately to the two ends of the steam cylinder, and as an auxiliary valve, it is oscillated so as to open and close the steam ports that lead to the ends of the steam chest. The steam chest is cylindrical and bored out to make a face for the slide-valve and to receive the pistons that assist in operating the valve. The pistons are connected together, sufficient space being allowed between them for the valve and steam ports, and they are also connected to the slide-valve, all working in the same plane, and being of the same diameter, thus insuring evenness of wear and readiness of access for adjustment and

high, with pillars 35 feet thick, and cross cuts driven through into the next balance, and the first squared up, leaving a thin barrier of coal; but to gain time the next balance can be driven through the pillars of the bords of the first balance. The boxes are handled by the miners, and two boys can transfer the coal from a dozen bords to the level, without any assistance from horses, etc.

When the seam pitches at an angle heavier than 25° there are two modifications of this system that can be adopted. By one of them the track in the balance is done away with, and the coal tubs of each bord are emptied into the

balance itself. In this case the coal will run either in the pavement or in a shoot made of iron sheets. At the point where the balance meets the level, the shoot is carried at a lessened angle so that it will project into the level at a height sufficient to allow the pit tubs to pass under its mouth. They are filled by lifting a door at the mouth of the shoot opened by the driver with the assistance of a lever. In the other modification the bords are driven directly to the rise from the level and a shoot laid in each one. The coal is loaded from the shoots on the level in the manner just described. This system has not been generally approved of from the difficulty of airing so many uphill places, and the

cost of getting timber to the faces, etc. On the other hand, the cost of material is less, there being no rails or tubs required in the bords, and the pillars are formed parallel to the dip of the seam.

In the Pictou and Cumberland districts, of late years, the seams, whenever local conditions permitted, have been opened by slopes. The slopes are usually driven in pairs, with one or more back slopes for ventilation. A crop pillar of two or three hundred feet being left, the first levels are turned away at a distance of six or seven hundred feet from the crop, and operations carried on as from a shaft. The slopes are driven wide enough to admit of a double track of

MAIN SEAM WORKINGS

PICTOU CO.

PLAN No. 3.

SCALE 30 YDS. = $\frac{2}{3}$ OF AN INCH.

PLAN No. 1.

This sketch shows the old method of working pitching seams referred to in May issue of this paper.

METHOD OF WORKING PITCHING SEAMS.—NOVA SCOTIA.

SCALE 30 YDS. = $\frac{2}{3}$ OF AN INCH.

PLAN No. 2.

the gauge of the pit tubs, usually from 1 foot 6 ins. to 2 ft. 6 ins., and provided with the usual switches. The signalling is done by wire signal cord striking a gong or giving a blow by means of a hammer on an iron plate. This method answers with a well stretched wire neatly hung and smartly handled, but electric signals would prove more satisfactory. The writer understands that the experience of H. S. Poole, Esq., agent, with electric signalling at the Acadia Colliery is so far satisfactory. Telephonic communication between the pit workings and the bank head has been tried, but at present is in operation only at the Vale Colliery. There is an arrangement made at some mines, whereby the ascending train of loaded tubs by striking a lever a few yards before the bankhead is reached rings a bell in the engine room and cautions the engine tender. To prevent the empty tubs from running down the slope should they escape the bankman's hands, a weighted lever is placed at the head of the slope, between the rails of the track for the empty tubs. When at rest, the unweighted end rises above the rails so as to engage with any descending tubs, while it offers no obstacle to the passage of ascending tubs, which are heavier than the weighted end.

In the flatter lying seams of Cape Breton, the methods of winning and working the coal do not differ materially from those common in England. Usually the levels are driven in pairs from the shaft bottom. Gate or horse roads are turned away from them, and the bords opened out of the horse roads at such angles as may best suit the requirement of the mine. As the bords advance the gate road is frequently turned up the first bord until it reaches a point near the working faces, when it resumes its normal course, so as to shorten haulage.

At the Gowrie Colliery bords are driven eleven yards wide and the pillars left seven yards thick. When the bord is first started a road is laid on each side, and the dirt, etc., are stowed in the centre. Afterwards a cut is made through the stowage, and the double road maintained only at the face. By this system under a moderate cover, the maximum of coal is got at the first operation, and the drawing of the pillars when the rooms have gone their distance, should give a good pillar coal with little danger of creep.

Pillaring.—The shape and size of pillars varies with the depth of the seam, and the nature of the roof. The earliest workings along the crops of the seams left small square pillars, which have frequently crushed and caused trouble by the admission of surface waters.

At Springhill between the 1,300 and 1,900 feet levels, the main "level pillar" is 100 feet thick, then succeed 12 feet bords, with 35 feet pillars, with the middle pillar of the balance 50 feet thick. There are seven bords on each balance, and the block of coal between the 1,300 and the 1,900 feet level is 550 feet wide. The loss of coal in working the bords and heads is about 18 per cent, and when taking out the pillars the loss is 15 to 20 per cent. in the high coal (9-14 feet), and in the low coal (4 feet thick) about 5 per cent. At the Albion Colliery, when working nine to fifteen feet of the upper part of the main seam at a depth of 90 feet, the bord pillars were left 35 feet wide and from 75 to 100 feet long, the level pillars being a little thicker.

In Cape Breton, at the Sydney (main seam) workings, in the earlier mining, the bords were 6 or 7 yards wide, and the pillars 10 by 14.5 yards. In the Queen Pit workings, 360 feet deep, the bords were 5½ yards wide. In the present workings, 600 to 800 feet deep, the size

of the bords has not been altered, but the pillars have been made a little larger.

The examples will serve to show the practice generally adopted. In a few collieries the extraction of pillars is systematically carried on, and usually closely follows the completion of a panel of bord and pillar workings. No regular rule has been laid down for the initiation and conduct of the operation. In some mines, as soon as the workings of any lift are finished, the pillars are drawn back; in others the pillars of each balance or shoot are drawn to suit the trade. The experience so far gained is in favor of former practice. Frequently, the extraction is so arranged, that the upper pillars are worked in advance of the lower ones, under a belief that by this means the roof is most readily let down and settled. In other cases the line of the full dip is taken as the range of the working faces.

The top and bottom pillars, forming the high and low sides of the levels of the various lifts, are allowed to remain untouched, in order to provide for drainage, etc., or the bottom pillar, immediately above the main level, is left to be taken out in the extraction of pillars in the next lift, whenever there is other provision made for air, etc. The pillars are either attacked from the lower end next the goaf, and carried back the full width, or a head is driven into the pillar and widened out sideways, first toward the goaf and then backward. The aim is to allow the roof to fall as quickly and completely as possible, to prevent weight from being thrown down-hill on the levels or any lower workings, and the timbering is proportioned so as to afford protection only for the removal of the succeeding pillar. But it will be understood that in steep seams, with questionable roof, having a thickness of from 10 to 15 feet, no hard and fast rule can be carried out.

In the flat lying seams of Cape Breton, little pillar work has been done except at the Caledonia Colliery, where the pillars lying under a pressure of 100 to 200 feet, and of good dimensions, have been successfully drawn.

In many cases, however, the pillaring has been viewed rather from the standpoint of a support to the roof than as a future supply of coal. The great question is that of water, and no doubt in many of the Cape Breton collieries worked at shallow depths, the increased pump costs would, at the present price of coal, outweigh any gain from the cheapness with which it can be mined in comparison with bord coal.

At present the most advanced mining practice in the province, is in favor of moderate sized pillars, to be drawn at the earliest possible moment. Even adopting this principle, except in a case of a few mines, the conditions of trade are unfavorable to extended and systematic pillar workings at considerable depths, for the shipments are interrupted during the depth of winter. When pillars are not taken out, the percentage of coal removed may vary between 25 and 35 per cent., when they are drawn, as high as 90 per cent. of the seam has been gained.

In Cape Breton the coal lying, as already mentioned, at easy angles is attacked through shafts, except at the Victoria and Reserve collieries. At the Victoria mine, at Low Point, the seam lies a heavy angle. Here two slopes spread out on the half pitch of the seam, and have, intermediate between them, one driven on the full pitch of the seam. This is used for ventilation and pumping, and will ultimately serve for the tail ropes of a system of haulage, which will pick up the tubs in the level and haul them direct to bank. The empty tubs running down the slopes by their own weight, will be taken

along the levels by the tail ropes. This arrangement will do away with the level horses. The balance system has been adopted here.

At the Reserve mine the seam was opened by a slope, but the mining wisdom of this procedure is doubtful, the seam lying at so low an angle that the empty tubs are landed with difficulty at the bottom of the slope. In order to provide more pit room, at a point in the slope, about ten chains from its mouth, a steeper slope, having an inclination of one in three and a half, has been driven to intersect the Emery seam lying 95 feet below the one at present worked. The following table shows the depth of the main shafts of the principal collieries:—

Sydney,	681 feet.	Round diameter 13 ft.
International,	87 "	14.5 by 16.5 ft.
Glace Bay,	224 "	10.5 by 11 ft.
Caledonia,	205 "	11 by 11 ft.
Gowrie,	260 "	11.5 feet diameter.

At the Sydney mines of the General Mining Association is found the largest shaft plant working in the Province. The main pump and back shafts were sunk under unusual difficulties from heavy feeders of water. The shafts are situated at the Northern point of Sydney Harbor, a few yards from the sea shore, and were intended to command the coal in an area of four square miles extending under the sea. At a depth of 200 feet heavy feeders of salt water reaching 1800 gallons per minute were met, and after severe exertions they were stopped by cast iron tubbing.

The following memorandum of tubbing used in the new shafts will be of interest:—

	Depth tubbed,	Segments,	Weight lbs.
Winding shaft,	275 ft. 6 in.	1269	658,724
Pumping "	284 ft. "	1168	569,639
Staple "	283 ft. 3 in.	736	323,975
			1,552,338

Underground, two large engines stand near the shaft bottom, and draw the coal along a rise engine plane with dip slants. The rope on the main level is an endless one. The train of full tubs starting from the landing near the face of the plane run by gravity to the pit bottom, and the train of empties is, drawn out by the tail rope. By means of square ropes lying in the dip slants, this system can be extended in any direction, and has been found to work satisfactorily for a number of years. Under this arrangement, horses are used only to collect and distribute the tubs from the landings and working falls, and their employment for the long level haulage, which is over a mile on one side of the pit, is avoided.

At the International mine the coal to the rise of the shaft (80 feet deep) having become exhausted, a slope was driven from a point a few yards to one side of the shaft, on the full dip of the seam, for a distance of about 2,500 feet, and at an inclination of 5½°. The engine stands at bank and is signalled from the foot of the slope. The track is of the ordinary character, and a double rope being used, the employment of an automatic switch allows the train of empty tubs to pass the full ones, irrespective of the landing they are being drawn from.

At the Caledonia mine a portable engine and boiler have been placed underground at the head of the slope driven to the full dip. The smoke is led into the return. The system of raising steam underground is open to objections. Precautions are taken to remove the soot, and to lessen its liability to combustion, but any fire underground is a standing menace to a mine.

The writer is pleased to learn that preparations are being made to generate the steam, for the underground haulage at the surface, as such an

arrangement must add to the safety of the pit.

At the Gowrie mine the haulage from the dip slant is conducted on a system resembling that referred to as adopted at the International.

The tables of machinery will give full particulars as to size of engines above and below ground, their loads, steam supply, etc.

VENTILATION.

The furnace was employed for ventilating the Nova Scotia mines, until a change was made in 1871, by the introduction of a Guibal Fan at the Albion mines. This fan was ten feet wide, and thirty feet in diameter, and yielded 75,000 cubic

feet per minute at 47 revolutions, being driven by a direct acting engine having a 24 in. stroke, and 24 in cylinder. The length of air ways was about 15,000 feet. Afterwards fans were introduced at the Sydney, Intercolonial, Low Point, and Springhill collieries. At the latter the seams being inclined and close together, it was found practicable to use "blow down" fans placed directly over the downcast and driven by a belt, so as to air the mine in sections having comparatively short airways. The volumes of air in cubic feet passed per minute by these fans vary from 15,000 to 89,000. The highest record being that of the Intercolonial colliery, which during the year 1887 maintained an ave-

rage monthly circulation of about 85,000 cubic feet.

In Cape Breton at the Reserve, International, Caledonia, and Gowrie mines, furnaces are still used, but the rapid extension of the workings of these collieries during the past few years, renders a more efficient ventilating power imperative. At one mine only, the Gowrie, is there any opportunity given for the furnace to do proper duty. Here it is placed near the bottom of the drawing shaft, being connected with it by an ascending drift, which enters the shaft above the door heads.

Its dimensions are, length of bars 7 feet, height of bars above floor 2 ft. 6 in., width of bars 7 ft. 8 in., length of heated column 307 feet, height of crown of arch above bars, 5 feet.

The total length of air course is about 170,000 feet, least sectional area, 56 ft., average sectional area, 64 ft. There are two air courses, 8,000 and 9,000 feet long. This furnace passes on an average, 44,000 cubic feet of air per minute, with a consumption of about 1½ tons of coal during the twenty-four hours. The capacity of the furnace could be increased to about 50,000 feet if required.

At the other mines, wooden chimneys fifty to eighty feet high have been placed on the shallow crop pits, which were first used for ventilating, but as the efficiency of the furnace increases in a ratio much smaller than the increase in length of the upcast, these additions give little assistance. The furnaces are of the usual pattern, being of brick, with arched roof, and having the grate about 2 feet from the floor, about 6 feet wide, and 9 feet long. The volumes of air passed vary from 20,000 to 43,000 per minute, the consumption of coal varying from one to two and a quarter tons a day.

The furnace under favoring conditions of large grate area, roomy air ways, and a long heated column, forms an efficient ventilator, but the last named condition in our mines is but partially presented at the Gowrie colliery. At present, they are operated under conditions which should lead to the prompt replacement of the furnace system by mechanical ventilators.

The cost of the latter, if one of the smaller and semi-portable patterns be adopted, is but little larger, and it yields a much greater efficiency on the basis of coal consumption. Its work can be constantly supervised, its maximum capacity readily reached, and in case of accident if it be properly placed, it is readily available for renewing the ventilation of the patterns adopted here. The Guibal has most satisfactorily stood the test of steady and long continued

(To be Continued.)

MONEY ORDERS.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion; also in the United States, the United Kingdom, France, Germany, Italy, Belgium, Switzerland, Sweden, Norway, Denmark, the Netherlands, India, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4.....	2c.
Over \$4, not exceeding \$10.....	5c.
" 10, " " 20.....	10c.
" 20, " " 40.....	20c.
" 40, " " 60.....	30c.
" 60, " " 80.....	40c.
" 80, " " 100.....	50c.

On Money Orders payable abroad the commission is:

If not exceeding \$10.....	10c.
Over \$10, not exceeding \$20.....	20c.
" 20, " " 30.....	30c.
" 30, " " 40.....	40c.
" 40, " " 50.....	50c.

For further information see OFFICIAL POSTAL GUIDE.

Post Office Department, Ottawa.
15th Sept., 1888.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for supplying Coal for the Public Buildings, Ottawa," will be received at this office until THURSDAY, 11th JULY next.

Specifications can be seen and forms of tender obtained on and after Friday, the 21st June, at this office, where all necessary information can be had on application, also at the office of James Nelson, Architect, Montreal, and at the Dominion Public Works Office, Post Office, Quebec.

Each tender must be accompanied by an accepted bank cheque for the sum of \$30, made payable to the order of the Honourable the Minister of Public Works, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. G. BEIL,
Secretary.

Department of Public Works,
Ottawa, 11th June, 1889.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter with original bores of 3 and 3½ inches, bushings to be used for intermediate sizes; larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.
22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

APPLY FOR PARTICULARS TO **The Dodge Wood Split Pulley Co., 81 & 111 Adelaide Street West, Toronto.**

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 12 to 35 x 7 with ample power to give satisfactory speed, we can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a scaled glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALI,
Commissioner.

January, 1889.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

ONTARIO
Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

A. S. HARDY,
Commissioner,
Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or to work Minerals on any of their Mining Lands and Mineral Reservations,
Covering nearly a

Quarter of a Million Acres

In Eastern Ontario, and principally within the belts containing

Coal at Edmonton. — At Edmonton, a coal seam four feet thick crops out on the south bank of the Saskatchewan, forty feet above the water. A small quantity has been mined from it; but lately Mr. Donald Ross has run a drift into the north bank through a mass of quartzite pebbles slidden from above. The seam consists of three feet of good workable coal, overlain by about one foot of dark clay shale, which is again overlain by a considerable thickness of impure coal. It has not been found advisable to work this upper part of the seam, but it forms a very good roof for the drifts and rooms. The coal is being used in Edmonton at different forges and throughout the town generally. It burns well, both in stoves and in open grates, making a clear hot fire, and when stored under a roof can be kept for a long time in a perfectly serviceable condition; a quantity of this coal which had been lying in a shed for a year was still in lumps of fair size, and when burned made an excellent fire.

The Ditton Gold Field. All the reports bearing upon the gold of Quebec refer only to the Chaudière valley. Other areas are known which promise quite as good returns to capital well applied; among them may be mentioned the upper waters of the Salmon River, more particularly in the Township of Ditton. That attention has not been directed to this locality is in large measure due to the fact that what is regarded as the most promising field for work is entirely in private hands, and no royalty being in consequence paid to the Government, no official returns are available as to the amount of the precious metal obtained. Alluvial gold has, however, been found there and worked for many years. The place where operations have been more particularly carried on is on the Little Ditton streams, on Lots 23 and 24 R.W. Ditton. Nuggets ranging in value from \$50 to \$150 are reported as having been found. The rocks are black, wrinkled, and sometimes pyritous slates and grey sandstones, in character similar to much of those on the upper part of the Chaudière, and also to those of the gold series of Nova Scotia. Veins of all sizes, up to several feet, traverse the slates, generally with the bedding, though occasionally transverse to it. No attempt has yet been made, in so far as could be ascertained, to test the value of these veins, though that some of those on the Little Ditton are auriferous is proved by the finding of ragged gold in quartz in close proximity and below them in the bed of the river.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High
Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

Vol. VIII. JULY, 1889. No. 7.

Chemical Contributions to the Geology of Canada.

One of the most important and responsible, while at the same time, perhaps the least known position in the Geological Survey, is that of the Analytical Chemist and Mineralogist. Working as he does, quietly and unobtrusively, in his laboratory, it is on the results of his experiments that many of the conclusions arrived at, and published officially to the world, are based.

Mr. G. C. Hoffman, F.R.S.C., who fills this position, has long ago established his reputation, and is an acknowledged authority on mineralogy. We have before us Part T of the Annual Report of the Geology and Natural History of Canada for 1887, which contains "Chemical contributions from the laboratory of the Survey," a mere glance through which will convey to those who know anything about assays, the labour involved in the preparation of this publication. Mr. Hoffman says that his work, during that year, was "purely of a practical character, having been confined exclusively to the examination of such minerals and specimens as promised to prove of economic importance." He was assisted in his work by Mr. Frank D. Adams, M. A. Sc., who, by the way, has just been appointed a professor in McGill College University, a well merited acknowledgment of his skill, and by Mr. E. B. Kenrick, B.A., as junior assistant, who has also left the Survey for a better position at St. John's College, Winnipeg. Whilst wishing these gentlemen every success in their new spheres, it seems a pity that their services should have been lost to the country, and we are afraid that the spirit of economy, as far as remuneration for valuable services is concerned, may in this case, and in some others, tend to prove the truth of Solomon's words, "There is that withholdeth more than is meet, but it tendeth only to penury."

The principal Assays dealt with by Mr. Hoff-

man were: Lignite from the Saskatchewan river, coal from the Rocky Mountains and the Pacific Coast, iron ore from various parts of the Dominion, precious metals from various quarters, and a variety of specimens of a general character, the assays of which tend to show the value of the deposits from which they were obtained. One very interesting contribution, in addition to the minerals, is an analysis of the water from the Thermal Spring at Banff, and another on water from a mineral spring near Belvedere, Province of Quebec. With regard to mineral waters, it is remarkable how little reliable information there is in print respecting them, and, with the exception of one article, some years ago, from the pen of Dr. Sterry Hunt, on mineral waters, we doubt if there is any Canadian publication confined entirely to this subject. We noticed some two years ago, an article in "Wood's Medical Cyclopaedia," by Dr. B. Small, of this city, on Mineral Springs, which has attracted a good deal of attention, more especially in the United States, where the work is published, though we have seen it referred to in Canada. This article is, we believe, the latest contribution published on this subject.

The analysis of the Banff waters in Mr. Hoffman's report is credited by him to Mr. F. D. Adams, the gentlemen referred to above, and is the most comprehensive in detail yet made. The report does not say where the analysis was made nor what time elapsed between procuring the water and the analysis itself. These are considered by experts to be material points in this relation. Mr. Hoffman states that many more examinations are made during the year than those, the results of which are published, the latter only containing those likely to prove of general interest. The extreme accuracy in the work of assaying is made apparent especially in the report on a specimen of tin ore, reported to have been found in Compton County, P. Q. Mr. Hoffman says: "On two of the fragments were observed what apparently consisted of imperfectly removed labels." With microscopical power and chemical action all possibility of palming off in any case spurious specimens is entirely done away with. We are of opinion that when the time comes, which we hope is not far distant, for the publication of a new "Geology of Canada," similar to that got up by Sir Wm. Logan, it would be a boon to Scientists generally if the various assays made by Mr. Hoffman year by year and published in the Annual Survey Reports, were compiled into one volume. Separated, as they are at present, through so many different reports, it requires considerable search to find out any one particular analysis, and, where all are of so much individual value, a work of this nature, properly indexed, would not only be of value in itself, but would tend, if possible, to make more public Mr. Hoffman's researches, so unobtrusively carried on.

Nitrates v. Phosphates.

The frequently quoted simile referring to the respective merits of nitrates and phosphates, as a plant food, that "the nitrate is like a glass of spirits, the phosphate like a plate of beef," is an exceedingly terse way of putting a generally acknowledged fact that, while the former is a mere stimulant, the application of phosphate adds permanently to the fertility of the soil. The simile, however, might with equal accuracy be continued as follows:—"But a combination of the two is like a substantial dinner."

The application of science to agriculture is of comparatively recent date, but, nevertheless, the progress in agricultural chemistry has wrought, as was to be expected, a corresponding advantage in the art of farming. It was soon ascertained that the artificial barrenness produced by exhaustion yields, under proper conditions, to the touch of science. Certain constituents, it was found, are indispensable for plant growth, and of these the largest quantities were continually being withdrawn. Chief among these constituents are phosphoric acid, nitrate of potash or soda, and ammonia. Most agricultural soils contain sufficient iron, magnesium, calcium, chlorine, sodium, and sulphur to last for ages; but the disproportion between the amount of the three former ingredients required by plants and the amount replaced in the soil by nature is so great that exhaustion of these elements follows as the necessary consequences of continuous cropping.

The application of science to agriculture resulted in nothing more and nothing less than the creation of a new industry, namely, the production of "commercial fertilizers."

The introduction of artificial fertilizers marks, therefore, a new epoch in the history of agriculture. Their general acceptance in common farm practice is equivalent to the introduction of a new force. They have revolutionised the mode of agriculture as thoroughly as steam and electricity have revolutionised transportation and commerce. By their judicious application a barren soil can be changed into one of great productiveness. Therefore the principal functions of a good fertilizer are to supply to the soil the three elements of plant-food usually wanting in poor or exhausted lands, viz., phosphoric acid, ammonia, and nitrate of potash or soda.

The application of scientifically prepared concentrated plant-food to the soil forms a means of estimating the progress which a country is making in the domain of agriculture. The marvellous ease and rapidity with which France paid off the enormous war indemnity of five milliards of francs has justly taken the world by surprise. Yet to a great extent it was due only to the wealth Frenchmen knew how to derive from the land they live on by a generous and intelligent method of farming, and to nothing else can this be ascribed but a practical recognition of the value of artificial manure.

Is it not strange, therefore, in the year 1889, when it has been clearly and repeatedly proved by all the leading scientists of the day, as well as by practical demonstration, that each and all of the three elements enumerated above are requisite and necessary to form the basis of a satisfactory and practical fertilizer, that men of intelligence can be found antagonistically debating the respective merits of phosphoric acid, as represented by the general term of "phosphates," and nitrates of soda and potash, usually designated "nitrates"? This is clearly attributable, however, not to a lack of knowledge of the scientific facts as they exist, but because of the different financial interest involved in the two

industries, thereby causing an undue advocacy of the particular chemical ingredient in which the several parties have embarked their capital.

The time is rapidly approaching when such a state of things must end; already those most largely interested in the nitrate industry have accepted the teachings of science in regard to this question of superiority or inferiority of the respective elements, and—appreciating the certainty of an almost universal demand in the future for a concentrated fertilizer containing all the beneficial qualities to be derived from a judicious combination of phosphoric acid and nitrate of potash—are alive to the necessity of securing a substantial interest in the comparatively limited supply of the crude phosphate rock.

The average farmer's knowledge of plant, physiology, and agricultural chemistry is, as a rule, of a very limited nature. He is not able to determine for himself what are, or what are not, those essential elements of food plants which he desires to procure for his land; but he is rapidly becoming educated up to a proper understanding of the various elements, and their relative value to the soil.

The literature published by the Royal Agricultural Society of England and the Bath and West of England Society is having a very beneficial effect in this direction, and the statistics and results of experiments therein published have in the past, and will still more in the future, clearly demonstrate that the very best results are to be derived, not from the use of nitrates or superphosphates alone, but by an intelligent use of the two in combination.

As evidence of this, Mr. J. E. Knowles, the chairman of the Experimental Committee of the Bath and West of England Agricultural Society (1888-89) states in his report that the results of twenty-four experiments in relation to wheat-growing showed "that nitrate of soda and sulphate of ammonia, when combined with superphosphate, have each given a larger produce both in corn and straw than either used alone." In the same publication the same satisfactory results were noted in reference to the oat crop. Experiments were made on $\frac{1}{2}$ -acre plots with the following results:—"The unmanured plots produced at the rate of 21 bushels per acre. By spending £1 1s. an acre in nitrate of soda (70 lbs.) and superphosphates (168 lbs.) the produce of grain was exactly doubled, and there was an increase of straw of 864 lbs., this increase in corn and straw being equal in money value to 2*l.* 10*s.*, or a clear gain, after deducting cost of manure, say, 30*s.* per acre."

"In the plots where sulphate of ammonia alone and nitrate of soda alone were used there was a small gain of about 6*s.* per acre."

Similar experiments on "grass" resulted as follows:—Unmanured, 4 cwt. 1 qr. per acre of hay; sulphate of ammonia, 5 cwt. 2 qrs. of hay; nitrate of soda, 5 cwt. 1 qr. 7 lbs. hay; nitrate of soda and superphosphates combined, 6 cwt. hay.

No clearer proof can be required to demonstrate beyond a doubt the unquestionable advantage of this combination, and it will be unnecessary, therefore, to trouble the reader with detailed results of the numerous other trials made.

That both the nitrate and phosphate industries have reached gigantic proportions, notwithstanding unreasonable opposition, may be gleaned from the following figures:—

	Tons.
Nitrates used annually in the United Kingdom and Continent.....	600,000
Nitrates used in United States (about)	90,000
Phosphates imported into United Kingdom alone (1887).....	283,415

Superphosphates and fertilizers mainly based on phosphates, used in the United States (1886)..... 1,006,631
Of this quantity 616,631 tons were used in the Southern States in the cotton districts.

It is difficult to estimate to what proportions this business may grow when a loyal combination is once established between the two interests, which, as we have pointed out above, must be the inevitable and speedy result of the march of progress and intelligent agricultural enterprise.

The question then arises—and it is a question which has given great concern to the manufacturers of fertilizers both in Europe and America during the past year—Where are we to look for our future supplies of crude phosphate rock which the satisfaction of this ever-increasing demand for plant-food necessitates? That the question is one of great moment for the consideration of manufacturers is evidenced by the serious anxiety evinced on this point by Mr. Herman Voss—himself the manager of one of the largest fertilizer manufacturing companies in the world—in his admirable paper read before the Chemical Manures Manufacturers' Association on 10th December, 1888. He therein stated:—"The consumption of phosphatic manures, partly owing to the use of large quantities of nitrate of soda and ammoniacal manures, is rapidly increasing all over the world, and our supply is at present dependent upon so few sources that I consider it necessary and advisable to change our mode of selling superphosphate in such a way that we could also draw from other sources which would strengthen our hands as manufacturers."

It will be noted that Mr. Voss not only expresses anxiety as to the present limited sources of supply of the crude phosphate, but strongly emphasises the fact we have demonstrated above, that any increased use of nitrate of soda, as a matter of course, will increase comparatively the demand for phosphatic manures.

The present imports of crude phosphate rock into Great Britain, as stated by Mr. Voss, are derived from the following sources (1887):—

	Tons.
United States.....	165,275
Canada.....	19,194
Dutch West Indies.....	9,505
British West Indies.....	6,451
Spain and Portugal.....	15,612
Belgium.....	45,322
Holland.....	4,778
France.....	11,140
Australia.....	350
Haiti.....	3,014
Brazil.....	1,200
Other countries.....	1,544

Total..... 283,415

From these figures it will be seen that to supply the requirements of Great Britain alone for the next ten years, provided the demand does not increase, will require an output of about 2,834,150 tons, and it is but reasonable to assume that long before the expiration of that time many of the older sources of supply, from which there has been a continuous drain for many years past, will be completely exhausted. On the other hand, it will be noted that the Canadian supply up to the present has only amounted to about 8 per cent. of the British consumption, notwithstanding the well established fact that the phosphate deposits in the Dominion cover such an enormous area as to warrant the assumption that in the near future Canada will take a foremost place in the world's supply of this invaluable mineral.

It will be noticed that the largest producing countries at the present time are the United States and Belgium. A reference to Mr. Voss's admirable paper shows that the average percentage of phosphate of lime in the Belgian product is not more than 50 per cent., while that of the United States contains about 60 per cent. The Canadian mineral, as imported into Great Britain averages, however, from 80 to 85 per cent. of phosphate of lime, and may at once be set down as one of the highest grades of phosphate rock the world produces.

When we take into consideration that, in order to produce a really high-grade phosphatic manure compound (for which intelligent agriculturists are year by year becoming more exacting in their demands), it is a necessity that manufacturers should procure a correspondingly higher grade of the raw material—and, if proof of this is necessary, it is to be found in the fact that makers are willing to pay a much higher price per unit of phosphate of lime for the richer minerals than they are for that of poorer quality; thus, for example, while a manufacturer is paying, say, 7*d.* per unit for a 50 per cent. phosphate, or 29*s.* 2*d.* per ton and 9*d.* per unit for one of 60 per cent., or 45*s.* per ton, he is willing to pay about 1*s.* per unit for the higher-grade Canadian, or 4*l.* per ton for an 80 per cent. grade, and 4*l.* 5*s.* for one of 85 per cent.—it must readily be seen that the Canadian miner must always be in a position to produce his material at a decided advantage over any of his foreign rivals.

The question then naturally arises, if this be the case, how is it that the present output is so limited?

The reply is to be found in Mr. Voss's remarks under the head of "Canadian Phosphates," as follows:—

The Canadian mines commenced to be worked some ten years ago, and the output now amounts to about 25,000 tons per annum. Our imports from Canada were:—

Years.	Tons.
1881.....	8,187
1882.....	16,531
1883.....	15,716
1884.....	21,484
1885.....	18,069
1886.....	19,194

So that it will be seen that in six years the output has increased about 250 per cent.

Capital is the agent most required in Canada to build up and develop her mining industries. With it much more could be accomplished; without it Canadians are unable to avail themselves to the full extent of their rich phosphate territory.

Canada offers to the British capitalist a large and profitable field for investment in her phosphate properties. As the great and vital question of the future supplies of fertilizing materials becomes more widely discussed capital will assuredly flow into Canada for the purpose of developing this profitable industry; but it behoves every Canadian, every man interested in the great future of this business, to see that the interests of the British investor are safeguarded by countenancing only those mining schemes which can bear honest investigation, and that will provide a fair and reasonable expectation of returning to those who invest their money in these properties a good and permanent interest on their capital. Otherwise, notwithstanding the glorious future opening out for those at present engaged in the business, capital will seek investment elsewhere, and the advancement of the colony, as well as its mining industries, will be permanently impeded.

The Value of Prospects.

Prospects should not be overlooked, for without them a mine is of no practical value. The enquiry should be made as to what the prospects are—whether of a temporary or a more abiding character. Not a few mining investors are unacquainted with what they buy. Because mining shares are offered temptingly by unprincipled men, they buy without weighing the statements made which are sometimes quite inconsistent. Caution should be exercised, and advice sought of those in whom reliance can be placed. When a rich mine has been discovered in a previously unknown district many other mines are soon started around it, but because one mine has proved exceedingly rich it does not follow, as a consequence that all the same neighbourhood will be rich. The character then of the district is not to be estimated only by the success of one mine, but by its geological and mineralogical features. Having considered the district in which the mine is situated; the reports severally and collectively should be perused, and the character and ability of the reports should not be overlooked. It is not an uncommon plan for capitalists and investors to send their own agents to give a special report, and as practical and experienced men can be obtained at reasonable rates, the safer course is to engage them when the mines are easily accessible. Should the company be a new one it is well to notice whether the projected adventure is an old or abandoned mine. Old mines are rarely abandoned with "riches in sight," but justifiable reasons can often be given for their abandonment, and then investigation is courted. Being satisfied thus far, it should next be ascertained what the extent of the property is, the length of the run of the lodes or veins which traverse it, and how the lodes lie one to another. Then the distribution of metals may be ascertained, whether abundant or otherwise, and the quality of the ore.

The development of a mine will have shown it rich in depth. So long as a mine continues to open out rich in depth, and the value of the "ends" or drivings keep up, then the investor may rest assured that the mine is a good one. The reserves should not have been unduly entrenched upon, because on their success greatly depends. They are the dividends in embryo, the cash to come, the something to fall upon while explorations are being carried on in other parts of the mine. A good manager will always endeavor to keep up a two or three years reserve of ore, and to open up new ground at the same rate he is taking ore out of the mine. When large bodies of ore have been raised from a mine, unless precautions have been taken, serious accidents may occur which would endanger the prospects. "Slips" and "cavings in" sometimes occur, and, where these are likely matters become grave.

Coal Mining in Alberta

(Vancouver Daily World.)

There are few persons at present who are aware that Canmore, Alberta, is destined in a short time to rival as a coal producing centre, the far-famed Newcastle of England. Few persons will believe that within the beautiful valley of the Bow River, extending from Banff past Anthracite and Canmore to a point where the railway enters the Rocky Mountains, lies one of the finest coal regions on the continent. The coal found here is pronounced by experts to be of a superior quality to that of the famous Anthracite coal of Pennsylvania, and in a loca-

tion easily accessible to the Canadian Pacific Railway. Through the untiring efforts of Mr. C. Brinckerhoff, who, representing a St. Paul syndicate, has spent the past two years in prospecting the section for coal, is the public indebted for the valuable find that will revolutionize the coal trade of the whole Pacific coast. He has secured for his company several sections of the most valuable coal lands in the district, and is at present at work upon a splendid vein, 14 feet 2 inches in thickness, having a pitch of about 54 degrees, into which they are sinking a large shaft, having now reached a depth of 140 feet, the men working in three shifts of eight hours each, a number being employed outside the shaft in handling the coal, while another large force is at work on the numerous buildings being erected for the use of the company and the accommodation of the miners, for whom ample provision is being made. The dining room is at present capable of seating 40 men at one time, and will be enlarged when necessary. The sleeping quarters will accommodate 32 men and are perfect models of comfort and elegance, while, to make everything complete, a library and reading room is to be erected at once, in which will be kept all the latest newspapers and magazines, showing a liberal forethought on the part of the company.

In order to reach the railway from the mine an inclined plane is to be run from the head of the slope to the river bank, where the coal will be dumped into a large breaker, and discharged from it into the cars which are to be run out on a spur of the track from the station, nearly a mile distant. This portion of the work is to be commenced at once; and, as repeated tests have been made of the coal by President Van Horne, Superintendent Whyte and several engineers along the line, all of whom pronounce it the best they have ever seen, assures the ultimate success of the mines and the future greatness of Canmore as a mining centre.

The Canada Anthracite Coal Company are also making rapid strides in the development of their mines here, and are shipping several cars per day to Port Moody for transhipment to San Francisco. The understanding now is that their headquarters are soon to be removed from Anthracite to this point.

Non-Conductivity of Mineral Wool.

—The mineral wool consists of a mass of extremely fine interlocking fibers which form multitudes of minute air-chambers, to which is due the non-conductivity of the substance. The fiber is, however, extremely glass-like and brittle, and will not bear much handling. It doubtless merits the reputation which it has, of becoming broken and pulverized by repeated heating and cooling, and by the vibrations and jarring of steam-pipes. The powder then collects at the bottom of the paper bags, leaving the top of the pipes comparatively unprotected. This reputation the mineral wool shares with the asbestos fiber, but is certainly more entitled to it than the latter substance. Much has been said of the corrosive action of mineral wool upon iron pipes, and Prof. Egleston, in a paper read before the American Society of Civil Engineers, has demonstrated that under certain adverse conditions such a corrosion does take place. But it is probable that mineral wool made from slags that are free from sulphates and sulphides, those of lime particularly, will not be liable to this objection, especially if dampness of the coverings be avoided.

Detecting Minute Quantities of Iron in Minerals.—Alexander Johnstone, F. G. S., assistant to the professor of geology and mineralogy in the University of Edinburgh, states a new and rapid method for detecting minute quantities of iron in mineral as follows:

By means of a good strong flame, produced in the ordinary way by the mouth blowpipe, heat for a minute or two a small portion of the mineral, preferably in a powdered condition on clean platinum foil, with about four times its bulk of potassium nitrate or chlorate. The platinum should be heated from below, as it is not desirable that the flame should touch the assay. After the mass has been ignited, as stated, add to, *before it has cooled down*, by means of a piece of glass tubing, pure concentrated nitric acid, drop by drop, until not a single drop remains dried up. Next pour on to the top of the unevaporated nitric acid, also by means of a narrow glass tube, two or three drops of an aqueous solution of potassium sulphocyanide. A distinct red coloration will immediately arise and remain if any iron was present in the mineral examined. As this test is extremely delicate, nitric acid quite free from iron must be obtained; and it is essential that the potassium nitrate or chlorate should also be pure. The platinum foil must be perfectly clean, and the dropping tubes must be rinsed with water before and immediately after the application of each test.

Chlorination Works for the Lake of the Woods.

The indications are that the mineral deposits of the Lake of the Woods region are to be developed at last. The question of titles having been settled and everything made clear for the safe investment of capital, a company has come forward to establish works for treating ores, and promise to be turning out bricks of gold within three months. Mr. Henry J. Power who has been interesting himself in the scheme and who has just returned from Chicago, says that he has arranged to erect Chlorination Works at Rat Portage for the purpose of treating all kinds of gold and silver ore, even when the latter is carrying up to fifteen per cent of lead. By the chlorination process the ore is crushed, then pulverized, then subjected to electrified terraced plates, after which it goes through the pans, then through the agitators and finally concentrated. This process is repeated until the gold or silver is thoroughly separated from the ore. The plant necessary for the works is not very expensive, but is complete and will have capacity for all the ore that can be supplied. Mr. Power has arranged with companies owning mines to begin developing in time to have ore on hand by the time the mills are finished. Mr. Power is a practical miller, and has had experience either as proprietor, manager, miller or assayer in Michigan, the Black Hills, Colorado, Utah, Wyoming, New Mexico, Texas, Arkansas and other places. He believes that the minerals in the Lake of the Woods have good values and will give a good return. The people of Rat Portage have voted \$10,000 to aid the new works.

Shipments of British Columbia Coal.

The shipments of coal from the port of Nanaimo for month ending 30th June were:

Vancouver Coal Co.....	13,393 tons.
Dunsmuir & Sons.....	18,204 "
East Wellington Colliery....	1,884 "
Union Colliery (Comox)....	4,500 "

Sinking Appliances at Llanbradach.

An Interesting Paper Descriptive of a Plant in Which the Author has Applied Successfully a Number of Original and Useful Ideas.

BY W. GALLOWAY.

[From Proceedings of the South Wales Institute of Engineers.]

The sinking at Llanbradach has been undertaken by the Cardiff Steam Coal Collieries Company, Limited, for the purpose of winning and working the well-known steam-coal seams of the district. The shaft now being sunk is situate close to and on the west side of the Rhymney Railway, at a distance of $11\frac{1}{2}$ miles from the Bute Rocks at Cardiff, and it is thus about midway in a direct line between Pontypridd, at the bottom of the Rhonda Valley, and Risca Colliery, near the southeastern outcrop of the coal-field.

The great anticline which traverses the coal-field from west to east crosses the Rhymney Valley nearly at right angles to its general trend, at a point about half-way between Energlyn and Maes-y-Cymmer. Accordingly, if we follow the undulations of any seam passing from the south outcrop through the town of Caerphilly in a direction almost due north, we find the following changes of dip to take place: From the south outcrop the dip is towards the north, very rapid at first, and then more gradual, until the axis of the southern syncline is reached near the town of Caerphilly. The strata then rise toward the north, attaining a maximum rate of dip near Energlyn, and thereafter becoming gradually flatter until the summit of the anticline is passed, when they again dip towards the north at a moderate angle. The site of the shaft in question was chosen at a point about half a mile south of the summit of the anticline, principally with the object of avoiding the proximity of the two great faults which formed the northeast and southwest boundaries of the workings in Powell's Gelligaer Collieries.

The seam of coal worked in the southern syncline at Caerphilly, and known by the name of Llantwit or Maes-mawr, is either identical with, or, at any rate, occupies nearly the same geological horizon as that which was formerly worked in Powell's Gelligaer Collieries, and is still worked on a small scale in the same neighbourhood. It forms the upper limit of what is known as the Pennant sandstone series, which has a thickness of about 500 yards, or rather less, along the line of our imaginary section, being probably somewhat thicker towards the north than towards the south. It crops out in the northern rise near Energlyn, already referred to; and although the hills on each side of the Rhymney

Valley near Llanbradach rise to a height of upwards of 1,000 feet above sea-level, as far as at present known, they contain no vestiges of it. The mouth of the shaft at Llanbradach, on the other hand, is somewhat less than 400 feet above sea-level, and it follows that it will have to traverse about one-half the thickness of the Pennant series, including the ground occupied by the rock seams of the south outcrop, before reaching the Shale series proper.

Under these circumstances the Company elected to sink one shaft to ascertain the exact depth of the steam-coals, and to serve as an up-cast to the future colliery, before deciding upon the more important equipment of the principal winding shaft; but, at the same time, they determined to fit out this shaft in such a substantial manner as to be able to cope with all difficulties likely to be met with in sinking in

the ground which overlies and encloses the rock seams of coal in the Caerphilly hills.

The working pressure of the steam boiler at Llanbradach was fixed at 150 pounds per square inch, with the view of profiting as much as possible by the most recent improvements in steam-engine practice, such as working expansively either with or without compound or tripple-expansion engines. Only one boiler has been required up to the present; it is of the Lancashire type, is 8 feet in diameter by 30 feet long, consists entirely of steel plates, and was built and tested to a pressure of 250 pounds on the square inch, under the advice and supervision of the Boiler Insurance and Steam Power Company of Manchester.

A temporary brick chimney, only 30 feet high, was built in a position suitable to receive the products of combustion from two boilers of the

dimensions given above, as it was intended from the first to apply a forced draught until such time as the permanent chimney is provided. The forced draught is now applied in the following way, with the most satisfactory results: An air-tight chamber built of brick, provided with two wooden doors and an iron roof in which there is a window of thick plate glass, has been built in front of the boiler, the brick-work enclosing the boiler-front constituting one of its sides. A sheet-iron tube, 18 inches in diameter, branches from the pipe which ventilates the shaft at a point near to the ventilating fan (a 40-inch Schiele), and is led into one corner of the air-tight chamber, on the side furthest removed from the boiler-front, and there turned upwards at right angles, so as to blow the air towards the roof. In this manner a pressure equivalent to a column of water one inch high can be maintained inside the chamber, creating an excellent draught

Fig. 1. Guides. Elevation. Scale, $\frac{1}{2}$ in. = 1 ft.

ground such as has been described, and to act, in case of need, as a powerful auxiliary in winding coal from the greatest depth likely to be attained.

The shaft is 17 feet in diameter when finished, and is to be lined with brickwork throughout its entire depth. It is now (November 1, 1888,) 200 yards deep, and has passed through strata of a similar character to those found in Albion Colliery—saving only that the shales are thinner as a rule, and the sandstones thicker. This change in the nature of the strata was to have been anticipated, from the consideration of what takes place between Lady Windsor and Albion Collieries, and, again, between the latter and

through the boiler furnaces. The interior of the chamber is quite cool. The ventilating pipe leading to the shaft, and the branch leading to the air-tight chamber, are each provided with a loose-working throttle valve immediately beyond their point of junction with each other, whereby more or less air can be sent down into the shaft or into the air-tight chamber, as may be desired. The fan is worked by a belt from a small compound engine, with cylinders 6 inches and 12 inches in diameter respectively, by 8-inch stroke, expanding in the ratio of 8 to 1 when the valves make their full stroke, whereby the steam is cut off at five-eighths of the stroke of the pistons. The speed of the engine and fan is regulated by

Fig. 2. Guides. Plan, Scale, $\frac{1}{4}$ in. = 1 ft.

means of a screw-wheel inside the air-tight chamber, which actuates the links, giving an earlier cut-off when desired.

The feed-water passes through a Green's fuel economizer, in which it is heated before entering the boiler by means of the waste furnace gases, on their way to the chimney, after they have left the boiler-flues. The fuel economizer has 48 vertical pipes, each 9 feet long by $3\frac{1}{4}$ inches in diameter, and heats the water nearly to the boiling point. It was considered better to heat the feed water in this way than by turning the exhaust steam of the winding and other engines into it, as the oil and tallow used in lubricating the slide valves and pistons would otherwise have been apt to form a hard cake on the top of the boiler-flues, more especially with the high temperature of the water within the boiler—about 357° Fahr. Besides this, an opportunity was left of condensing the steam from these engines, and obtaining the advantages of a vacuum; and the temperature of the feed-water was likely to be more uniform than if heated at irregular intervals, as it would have been by the exhaust steam from the winding engine of a sinking shaft.

Fig. 3. Walling. Scale, $\frac{1}{4}$ in. = 1 ft.

The shaft now being sunk is, as has been already mentioned, intended to serve as the upcast, and it was, therefore, not considered essential to make the principal winding engine a compound one. Besides, the author was aware of the difficulties that had attended the introduction of compound winding engines in other districts, both at home and abroad, and wished to investigate the question experiment-

ally on a smaller scale, by means of another auxiliary winding engine, before applying the principle on a larger scale. The solution of this question which had presented itself to the author was the introduction of a reducing valve, properly so-called, between the steam-pipe leading from the boiler to the high-pressure cylinder and the pipe connecting the high and low pressure cylinders, regulated in such a manner as to maintain the pressure in the intermediate pipe, when the engine was not at work, as nearly as possible at the same average as the steam in that passage would naturally assume when the engine was working. In order to limit the quantity of steam passing through the reducing-valve to the smallest quantity necessary to accomplish the object in view, a screw stop valve was to be introduced in the pipe connecting the reducing-valve with the high-pressure steam-pipe, and a steam-pressure gauge on the intermediate pipe itself, for the purpose of enabling the reducing-valve to be properly regulated. Accordingly, in May, 1887, when specifying the details of a small auxiliary compound winding-engine to be employed in lowering bricks and mortar on to the walling stage, &c., the author included the reducing-valve, stop-valve, and steam-gauge, arranged as described above. This engine was erected at Llanbradach in October, 1887. It is identical with the fan-engine pre-

Fig. 4. Walling. Scale, $\frac{1}{4}$ in. = 1 ft.

viously described, except as regards the reducing valve, the steam stop-valve connected therewith, and the steam-pressure gauge; and it is connected to a drum, five feet in diameter, by means of helical spur-gearing in the ratio of six to one. Some preliminary difficulties were caused by the makers having, of their own accord, made the slide-valve of each cylinder to cut off steam at five-eighths of the stroke; but after the valves had been cut so as to admit steam during the whole length of the stroke, these difficulties entirely disappeared, and thereafter this compound engine became as satisfactory, and as easily controllable, as any other winding engine with two cylinders.

At first it was employed only for the purpose for which it was originally intended, but at a later date it became expedient to use it for raising water from a collecting cistern fixed on one side of the shaft, and then the great saving of steam effected by compounding became very marked, when its performance could be compared with that of the large winding-engine which had previously raised the same water from the bottom of the shaft at the same depth. As the author intends to describe more particularly the method in which this water is collected

and raised, at a later stage of the paper, he will only say in this place that this engine, before the last remove of the cistern in the shaft, raised water from it continuously day and night, with one rope, from a depth of 135 yards, at the rate of 30 to 35 tanks (2,500 to 3,000 gallons) an hour to the 20th of October, when the cistern was removed to a point 190 yards deep. From the latter point the same engine raised temporarily 25 tanks (2,125 gallons) an hour; but as the cistern collects over 5,000 gallons an hour, it became expedient to apply a stronger engine and a larger tank to the same end.

Fig. 5. Walling. Scale, $\frac{1}{4}$ in. = 1 ft.

The principal winding-engine has two cylinders, each 24 inches in diameter by 4-feet stroke, connected directly to the shaft of a drum 14 feet in diameter. It is provided with equilibrium slide-valves and Allen valve-gear, and the dimensions of its principal parts are as follows:

Piston-rods, 5 in. dia.
Connecting rods, 5 in. dia. at the ends.
Crank pins, 6 in. dia. by 8 in. in the bearings.
Drum-shaft, 11 in. dia. by 18 in. in the bearings.
Drum-shaft 13 in. dia. in the drum-heads.
This engine was built by the well-known firm of engineers, Llewellyn & Cubitt, of Penter Pontypridd, and has continued to give unqualified satisfaction since the first day it commenced to work. As the author anticipated, it works as smoothly, and is as easily handled, at the high pressure as a larger engine is at a lower pressure. In ordinary work it raises 9,500 lbs., consisting of

Rope, say.....	800 lbs.
Water-barrel.....	2,500 "
Water	6,000 "
Rider..	200 "
	9,500 lbs.

at the rate of 30 feet per second, thereby developing over 500 horse-power; but this is not by any means the limit of its capacity.

Fig. 6. Walling. Scale, $\frac{1}{4}$ in. = 1 ft.

The loads raised and lowered by each winding-engine are steadied by means of wire-rope guides, applied according to the system patented by the author in 1875, and first made use of in that year at Penrhwyf Colliery, belonging to the Glamorgan Coal Company. There are two guide-ropes to each engine, one on each side of the winding rope, and the three ropes of each system hang in the same vertical plane, one system, in this case being at right angles to the other.

At the surface, the guide-ropes of the principal winding engine pass over pulleys, *a*, *b* (Fig. 1), and are coiled upon the drums of a screw steam-crab at some distance from the shaft. These drums can be worked either separately or simultaneously, so that one guide-rope can be raised or lowered by itself, or both can be raised or lowered together. The lower extremities of these two guide-ropes are attached to the walling stage (Fig. 4).

The rider, *r* (Fig. 1), consists of three principal pieces of iron, namely: a cross-bar in which there is a central opening three inches in diameter, which fits loosely around the winding-rope, and two vertical lgs bolted to the cross-bar, and having similar openings about two inches in diameter for the guide-ropes, both at their upper and lower ends. A circular iron plate, six inches in diameter, rests in a horizontal position upon the cap of the winding-rope,

Fig. 7. Walling. Scale, $\frac{3}{8}$ in. = 1 ft.

and serves as a base for an india-rubber buffer, six inches in diameter by six inches thick, which surmounts it. The extremities of the guide ropes are provided with similar india-rubber buffers, 4 inches in diameter by 4 inches thick. When the end of the winding-rope is raised above the walling stage, the rider is caught up by the buffer at its end, and slides on the guide-ropes; on the other hand, when the end of the winding-rope passes below the stage, the rider is left standing upon the buffers at the ends of the guide-ropes, while the load can be lowered to any desired depth through a central opening in the stage. By this arrangement the stage is permanently suspended in the shaft, and is ready at a moment's notice for any service that may required of it; and the buckets, &c., are as quickly and easily steadied (whatever the depth of the shaft may be) as if the winding-rope was not longer than the distance between the stage and the bottom, which, for convenience, is usually about 15 or 20 yards.

In former applications of this system, the stage consisted of a simple wooden disc, suspended by means of chains to the ends of the guide-ropes, and having a central opening 6 feet square, through which the load passed upwards or downwards, as the case might be. At Llanbradach the stage is a much more substantial structure, and may here deserve notice as an improvement upon its predecessors. It is repre-

sented in Figs. 3, 4, 5, 6 and 7, and consists of the following parts, viz.:

a. A wooden floor (Fig. 5), partly fixed to an angle-iron frame, partly movable.

b. An upright tube (Fig. 3), fixed to the iron frame of *a*.

c. A horizontal iron frame (Fig. 7), fixed to the pieces of angle-iron which form the corners of the tube.

The lower frame (Fig. 6) consists of four pieces of angle-iron, d^1, d^1, d^2, d^2 , 5 inches by 5 inches by $\frac{5}{8}$ inch, crossing, each other, two and two, at right angles; a circular band of angle-iron, *e*, *e*, 4 inches by 4 inches by $\frac{1}{2}$ inch, in three segments, joined to the ends of six of the pieces d^1, a^2 ; and a straight piece of angle-iron, *f*, 5 inches by 5 inches by $\frac{5}{8}$ inch, joined to the shorter ends of d^2, d^2 , and to the ends of the circular frame, as shown.

Part of the wooden floor *g* (Fig. 5), is bound together by means of four straps of iron, two above and two below. One of its ends rests on the circular angle-iron, and the other on the cross-piece, d^1 ; but it is not fixed in any way, and can be lifted out of its seat and removed when desired.

Fig. 8. Pneumatic Water-Barrel. Scale, $\frac{3}{8}$ in. = 1 ft.

At the other side of the stage there is a hinged door, *h*, forming the smaller segment of the circle, which can be raised up into a vertical position as shown in Fig. 4, or let down into a horizontal position (Fig. 5). It is held in the latter position by two chains attached to the ends, *k, k*, of the frame-work of the roof. When the stage is taken past the pipe buntons, this door is raised up. It is provided with an opening large enough for the ventilating-pipe. All the timber is 5 inches thick, and, except that which constitutes the hinged door and the part *g*, it is all bound strongly to the iron frame-work. The latter is held together by $\frac{3}{4}$ inch rivets.

The tube consists of four upright corner-pieces of angle-iron, 5 inches by 5 inches by $\frac{5}{8}$ inch, which connect the upper frame with the lower one. Four plates of sheet-iron $\frac{1}{4}$ inch thick, attached to the four uprights just named, form a fence 6 feet high round the central opening in the stage, which is 6 feet 6 inches square.

The roof is 10 feet 6 inches above the stage proper. It is formed similarly to the floor, has a rather smaller diameter, and is covered with sheet-iron $\frac{3}{8}$ inch thick, except above the door and moveable part *g*, which are left uncovered. Its central opening is 5 feet 6 inches square.

The tube has thus the form of a frustum of a quad-rangular pyramid.

The stage is suspended from the guide-ropes as shown in Fig. 4, the caps at the ends of the ropes being attached directly to the eyes of the

suspending rods, *l*, one on each side of the centre of the shaft. An iron ladder, *m* (Fig. 4), provides a means of access to the roof, and *vice versa* through the opening, *n*, in the sheet-iron cover.

The guide-ropes are made of steel wire; each of them is $3\frac{1}{2}$ inches in circumference, and is calculated to have a breaking strain of 33 tons, or thereby. The stage weighs about 5 tons, or a little over. The guide-ropes are 5 feet 6 inches apart, center to center, so that the center of each is 2 feet 9 inches distant from the center of the winding-rope.

The top of the shaft is covered with 4-inch planking, except over the two areas occupied by the two pairs of balanced doors, *a, a* and *d, d*

Fig. 9. Pneumatic Water-Barrel. Scale, $\frac{3}{8}$ in. = 1 ft.

(Fig. 2), The balance-weight of the doors *d, d* is shown at *c*, and the lever at which they are opened and shut at *b*. The corresponding balance-weight and lever of the doors *a, a* are omitted from the drawing for the purpose of avoiding complication. Suffice it to say that both pairs of doors are balanced in every position—open, shut, or intermediate.

In all former applications of the system the cranks, rods, and levers which connected the doors with the balance-weights, and with the handle for manipulating them, were overhead. At Llanbradach they have been brought down to the same level as the covering of the top of the shaft. The rider is shown at *r* (Fig. 1), with a bucket suspended below it. The buckets are 3 feet 9 inches in diameter at the top, 3 feet 4 inches in diameter at the bottom, and 3 feet 6 inches deep, so that each contains about $34\frac{1}{2}$ cubic feet when filled to level with the top. They are emptied into triple-center, side, and end tipping wagons of steel, without being detached from the winding-rope.

(To be Continued.)

Acknowledgment.—We are indebted to the courtesy of the Colliery Engineer Co., Scranton, Pa., for the use of the cuts illustrating the foregoing paper by Mr. W. Galloway.

PHOSPHATE.

Ocean Shipments.

The following is a statement of the Shipments of Canadian Phosphate from the port of Montreal since our last issue to 8th July :—

Date.	Vessel.	Destination.	Shipper.	Tons.
June 10.	Ripon City.....	Hull.....	Millar & Co.....	260
" 13.	Saturnina.....	Liverpool.....	Wilson & Green.....	401
" 21.	Zambesi.....	".....	Millar & Co.....	300
" 25.	Montreal.....	".....	Lomer, Rohr & Co.....	270
" 27.	Lake Ontario.....	".....	Lomer, Rohr & Co.....	200
July 3.	Vesta.....	Glasgow.....	Wilson & Green.....	200
" 6.	Colina.....	".....	".....	15
" 8.	Etna.....	Hamburg.....	".....	244
				1890

RECAPITULATION.

Lomer, Rohr & Co.....	470 Tons.
Wilson & Green.....	860 "
Millar & Co.....	568 "
Total.....	1890
Liverpool.....	1371 Tons.
Hamburg.....	244 "
Glasgow.....	15 "
Hull.....	260 "
Total.....	1890

The estimated value of phosphates exported from the Kingston district during April and May, as per Customs returns, was \$3,940. Of this 279 tons were shipped to Great Britain.

A little over 1000 tons have been shipped to European points from the Blackburn mine, Templeton, since opening of navigation.

British Fertilizer Market.

We are indebted to Messrs. Couper, Millar & Co., London, for the following report of the British Fertilizer market since our last issue :—

Since the issue of our last circular, business has been somewhat restricted, manufacturers holding off, as they are unwilling to believe in the advance in the price of phosphates which has been established. Within the last few days there has been more disposition to contract for next season's requirements, and the continental demand continues active, more especially for high test. The prices ruling in America for South Carolina restrict shipments to Europe, and the demand there in the immediate future is more likely to increase than diminish. Nitrate of soda is firmer, even though the season's demand is about over, while sulphate of ammonia is very steady.

Mineral Phosphates.—Canadian is more appreciated on continent than in U. K. For 80 per cent. 1/0½ ex ship London and Liverpool may be considered to-day's price, with 75 per cent. at 11d. and 70 per cent. 10d. per unit, all with one-fifth of 1d. rise. South Carolina 9¾d. to 10d. Somme, of the higher tests, enquired for, but not to be had except at extreme prices. Belgian 40 to 45 per cent. and 45 to 50 per cent. we are sellers of, prices according to port of discharge.

Bone Ash, Bones and Meal.—No enquiry for ash cargoes, but more disposition to operate in bones forward. Bone meal dull and sales of Bombay at £4 13s. 9d. to £4 15s. 0d.

Nitrate of soda firmer at £8 7s. 6d. to £8 10s. 0d.

Sulphate of ammonia very steady at £12 2s. 6d. per ton.

Ammoniacal materials wanted. Fish Guano and ground hoofs and horns we have sold for-

ward, but can still offer more. Dried blood does not command so much attention, prices asked being comparatively much too dear.

Muriate of potash is quoted at £7 5s. on 80 per cent. ; Kainit at 23/6 in bulk, 26/6 in bags, and Kieserit at 17/3, all f.o.b. Hamburg, subject to open river navigation. Net cash. Strassfurt weights and sampling.

In General.

The Hon. Gerald McGarel Hogg (son of Lord Magheramorne, K.C.B., late Chairman of the Metropolitan Board of Works, London, England), who spent last summer in Montreal studying the phosphate interests of Canada, has been admitted as a partner in the firm of Messrs. Couper Millar & Co., London, England, the well known phosphato importers whose Montreal House Messrs. Millar & Co. are the agents for the Canadian Phosphate Company, Limited.

Captain R. C. Adams, Managing Director of the Anglo-Canadian Phosphate Company, returned from England on the 5th instant.

Enquiries for Canadian phosphate lands have been numerous, but only from speculators who desire to offer them to the public. The response to such efforts as have been made in this direction have discouraged the promoters. There is no doubt, however, that an interest is being awakened in the Canadian industry that will eventually lead to the investment of British capital, and it seems certain that phosphates have a good commercial future.

Contract work for the Anglo-Canadian Phosphate Co. proceeds at the Otty Lake and Bobbs Lake Mines. The output for the past month at Bobb's Lake averages eight tons per man employed, a very satisfactory result. This property has developed so well that the management contemplate putting an enlarged system of day's work into operation.

Mr. W. Hamilton Merritt, M.E., Toronto, spent a few days last month examining a property near the High Falls, Lievre river, Que., in which Mr. Dalton McCarthy, Q.C., has a large interest. Foreman Holmes and a small force are doing development work here, and have opened up a number of shows which promise well.

Markets.

Markets are firmer and lower grades of phosphate may be quoted at 10d. for 70 per cent. an advance of 1¼d. since the season opened. There is some enquiry for 60 per cent. phosphate. Eighty per cent. is quoted at 12½d.

Safe Transportation of Sulphuric Acid.

—Herr Bickmann has patented in Germany a process for enabling sulphuric acid for manufacturing purposes to be safely transported. He takes advantage of a property of certain salts—of which alkaline sulphates are representatives—by which they give up their water of crystallization when heated, and take it up again when cool; and he does so by mixing the salts in an anhydrous condition with a calculated quantity of sulphuric acid. The whole mass becomes granular, or may be formed into cakes; and when heated the whole liquefies, and may be used as if it were sulphuric acid, for the presence of bisulphate of soda does no harm in many utilizations of the acid.

MINING NOTES.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

At the Annual Meeting of the Gold Miners' Association of Nova Scotia, held at Halifax, on 6th March, a resolution was passed adopting the "Canadian Mining Review" as the official organ of this Association.

Chester Basin.

Mr. C. E. Willis, manager, started the mill of the Neptune Gold Mining Co. last month. He reports the mill excellent in every respect, and says he has "the best little mill in the Province." Up to date the mill has crushed at the rate of 18 tons in 24 hours. The stamps, engine and boiler were furnished by I. Mattheson & Co., of New Glasgow.

Chezzetcook.

Mr. J. L. Graves, of Boston, has been making another test of his property here, preparatory to deciding whether he will continue work or close down indefinitely. Some work was done upon this property last fall, but with no encouraging results.

North Brookfield.

The Philadelphia Gold Mining Co. have contracted with I. Matheson & Co., of New Glasgow, for a 20 stamp mill complete, with a 60 h. p. boiler, and an engine. The company have hitherto used the mill owned by Mr. McGuire, operating it under a lease. This lease is about to expire, and the management feel secure enough of the prospects of the mine to build a larger and better mill of their own.

Miscellaneous.

At the regular monthly meeting of the Gold Miners' Association on the 5th July Mr. J. S. McArthur, of Scotland, was a guest, and explained to the members present the process which the Cassell Gold Extracting Co., Ltd., of Glasgow, Scotland, are now trying to get adopted in the gold fields of both Australia and the United States. Mr. McArthur, who is the technical manager of the Cassell Co., stated that they now had four different companies using their process with success in Australia. The process is patented in Great Britain and the colonies and in the United States. The process is essentially one of solution and precipitation, the solvent being a dilute solution of Cyanide of Potassium. It is claimed that 85% is extracted at a cost of less than \$20 per ton.

The Nova Scotia Iron, Coal and Railway Co. (Limited) has been organized under Charter granted by the Local Government, and the long talked of smelting works now bid fair to become a reality. The directors of the new concern are: J. P. Mott, Halifax, President; Graham Fraser, Glasgow, Scotland, Vice President; J. F. Stairs, Halifax, Thos. Bayne, Halifax, Wm. Jacks, ex-M. P., Glasgow, Forrest McKay, New Glasgow and Harvey Graham, New Glasgow. It is proposed to proceed at once with a thorough examination of their iron ore properties, and should the prospects prove satisfactorily, the erection of the furnaces and necessary plant will be at once begun. Those who look hopefully forward to the successful establishment of iron

smelting works in this district, must be gratified to find on the board of directors the names of gentlemen who have been associated with the iron industry of Pictou County from its infancy, and to whose skilful management and thorough business ability, the Nova Scotia Forge Co. and Nova Scotia Steel Co. (now amalgamated) owe their existence and their present prominent position among our local industries.

There is some improvement in the coal trade in Pictou County and this is particularly noticeable at the Drummond Colliery, where work of late has been fairly brisk, yet not sufficiently so to warrant the reopening of No. 4 Slope and the Scott pit, although rumours are current that the latter will be re-opened at an early date.

At the Black Diamond Mine work is, as usual, steady, any stoppage of work at this colliery having not as yet been due to any lack of orders. Another Slope is soon to be opened here for the purpose of winning an extensive block of coal of excellent quality; it is always gratifying to report the success of this enterprising company, while the harmony which exists between the management and workmen is certainly worthy of notice, and cannot fail to be productive of lasting benefit to all concerned.

At the Acadia Colliery work is also somewhat steadier, and the sinking of the new lift is progressing satisfactorily. There is some talk of a new hoisting engine being erected here, this will, however, be a necessity of the future, and will no doubt when erected be fully in keeping with the other machinery at the place, first class in every respect.

At the Albion Mines, the Acadia Company—not discouraged by frequent interruptions and a heavy expense—are pushing vigorously forward with the re-opening of the Foord Pit, Cage Pit Seam, and No. 1 Slope. A new steam pump (Knowles') has been put to work in No. 1 Slope, and good progress is being made with the drainage of the water. At the Foord Pit, despite many difficulties encountered, care and perseverance still characterise the conduct of the work, and the obstacles are gradually, but surely, being overcome. It is predicted by knowing ones that in another month the bottom of the shaft will be reached; your correspondent is one of many who hope for even better things. Very little coal is at present being raised at the McGregor pit, and miners employed there must, indeed, be feeling the pinch of hard times.

At the Vale Colliery work is exceptionally dull just now, only the McBean Seam being worked and very irregularly at that. This mine has recently been visited by several parties interested in the proposed new Iron Works, it is said with a view to purchase. Should the colliery pass into the hands of an iron company, it would doubtless be a means of providing steady work for the men employed there.

Ontario.

Application for incorporation is made by the National Gas and Oil Company of Canada with offices at Windsor, to carry on operations in the County of Essex. The capital is \$100,000 in shares of \$10.00 each. The applicants are:—Mary Agnes Burke, Windsor, John McArdle, of the same place, telegraph operator; John Atkinson Smith, of the same place, dentist; Charles Hilaire Deslisle, of the same place, hotel keeper, and William Goodwin Wood, of the same place, assayer.

The said John McArdle, John Atkinson Smith, and Charles Hilaire Deslisle are to be the first directors of the company.

We understand that the proprietors are at present negotiating for a sale of the well known Frontenac lead mine near Kingston. The property comprises the south half of lot 16 and the east and north parts of lot 15 in the 9th concession of Loughborough, containing about 200 acres, transversed diagonally for a distance of nearly a mile from south-east to north-west by the principal lead bearing vein, 10 to 12 feet wide, richly charged with galena, and cutting the country rock at right angles. On this vein two shafts have been sunk about half a mile apart. The eastern shaft, or No. 1, on lot 16, has been sunk nearly 200 feet, with an adit of 450 feet at a depth of 40 feet and 18 and 28 fathom levels along the vein and between its walls. The western shaft, or No. 2, on lot 15, has been sunk to about 30 feet, and the last ore raised from the bottom was a cubical mass of almost pure galena of about 200 pounds weight. This shaft is provided with a steam engine and hoist. At and near shaft No. 1 the following buildings have been erected:—(1) Shaft house. (2.) Dry house. (3.) Offices. (4.) Engine and crusher house, 82x44, with powerful engine and crusher. (5.) Dwelling house, 36x26. (6.) Boarding house, 48x21. (7.) Blacksmith's and carpenter's shop, 31x25. (8.) Barn, 36x24. (9.) Mill building, 66x60 and two storeys high, containing under one roof engine of 40 horse power, with two boilers, very complete pumping and hoisting machinery, drum, cables, &c., two sets crushing rolls, two sets jiggers, and other washing and dressing plant, Mackenzie blower, and American smelting furnaces. Lead to the value of \$25,000 was obtained from the mine by the late lessees. Mine and works have been carefully examined, and are very favorably reported upon by several of the best known experts in the country, including Prof. E. J. Chapman, Dr. Sterry Hunt, Dr. Robert Bell, and Sir J. W. Dawson. The largest interest in the property is now held, we believe, by Messrs. J. M. Machar and W. Romanes, Kingston.

Sudbury District.

Three car loads of machinery arrived at the Copper Cliff mine last week, where a second furnace is being put in by the company. They are down over 400 feet in the mine now, and on the second and third levels they found two immense pockets or domes, holding thousands of tons of ore—three parts copper and one part nickel.

The Simpson Bros. are still testing their 900 acre claim just east of Nickel City. They have found gold in seven different places on it, and have a crusher at work grinding out the rock taken from the test shafts. An old horse and a primitive apparatus, the same as that used in King Solomon's mines, makes about \$10 a day at it.

The new management of the Vermillion mine are preparing to work this magnificent property on a large scale. The great hill of decomposed ore on it is going to be tested with a diamond drill. It is estimated by mining experts that there are over a million tons of ore on this location alone, carrying from \$50 upwards of gold and platinum to the ton, besides enough silver to more than pay for working it. The silver in it averages \$11 to the ton.—*P. A. Herald.*

Port Arthur District.

A cablegram dated "London, England," states that "The bargain for the sale of the West Beaver mine has been closed."

Work is proceeding quietly at the Ottawa mine location. The ore is good and the prospects are that a large amount of money will be expended on the immediate development of the property. Leaf silver is being obtained.

The western shaft at Silber Mountain East is down about 400 feet and the silver is still found in abundance. A large shipment will be made in a few days to Great Britain. They are now taking out high grade ore every day, and on the whole the mine is looking well. If a railway were in operation the management would at once increase their force.

The following report has been received from Mr. Walpole Roland, C. and M. E., consulting engineer of the Silver Wolverine Co., (limited), dated Port Arthur, May 22nd: "Since date of my last report, referring to the rich strike of native and black silver in No. 1 shaft, at a depth of 82 feet and 90 feet, I have been unable to resume operations in this shaft owing to water. I have now, however, effected a purchase of hoist from the Beaver Mining Company that will fully answer our purposes. Immediately No. 1 shaft is made ready for further sinking, and the 100 feet level attained, we commence drifting from that point towards No. 2, between which points I anticipate cutting a rich deposit of black and native silver. In sinking No. 2 shaft, at a point 300 feet eastward of No. 1, after excavating some 13 feet of boulder drift and gravelly clay loam, they struck the vein. At this point the vein measures 4 feet 4 inches in width and carries the usual rich black blendes, fluorite and calcite together, with black silver and iron pyrites, and notwithstanding the fact that it is yet in the trap overflow.

The chief items of interest are the voting on the railway bonus by-law, on the 10th inst., at Port Arthur, as on it depends the immediate construction of the first fifty miles of railway into the silver and iron region south-west of Port Arthur.

In spite of the usual cry of boodle and the unpopularity of some of the Charter sellers, it is expected that the by-law will carry by a handsome majority. The Board of Trade and town Council are almost unanimously in favor of the scheme.

Mining locations are being sought after and bought up in view of the railway facilities. A large and enthusiastic meeting in the town hall, Port Arthur, was held last evening.

American tourists are doing the mines and the fishing in this vicinity in considerable numbers.

There has been nothing of special note to refer to in connection with the various silver mines. Favorable reports are daily received from the Badger, Beaver, Elgin, Silver Mountain, West End, Shuniah Weachu and Silver Fox mines.

The valuable buildings at the Jackfish or Huronian gold mines have been burned by bush fires. Nothing further will likely be done here until the Government road is completed to this property.

British Columbia.

The shipment of Texada iron ore amounted to 1,530 tons.

Shipping from the new Union Collieries has commenced. The latest reports speak most favorably of the several seams being opened. The principal seam being worked is now four feet of good merchantable coal, and as work progresses the thickness increases. The management are doing a good deal of prospecting on the property, two parties being at present working, one on Coal Creek and the other at Puntledge Lake. Three-foot seams have been struck on the latter, and thirty feet above an 18-inch seam. On Coal Creek, at the head of Allen Lake, a four-foot seam has been located, and a tunnel run in 200 feet. Above Allen Lake still another three-foot seam has been discovered. In fact the whole surrounding country seems to be one vast coal bed, and development will only prove that there is an inexhaustible area of the finest bituminous coal on the continent. The coal is said to be from 15 to 20 per cent. better steaming coal than the Wellington, weighs more per cubic foot (82½ pounds), though it does not ignite so rapidly. Up to 1st June it is estimated that at least half a million dollars have been expended on the property and in the provision of shipping facilities. The pay roll for May was over \$22,000.

The work of sinking the shaft at the North Field Mine of the new Vancouver Company, says the *Nanaimo Free Press*, is progressing most satisfactorily under the personal supervision of Mr. Robert Scott, the contractor. The shaft is now down over 300 feet, with about another 100 feet to reach the main seam of coal. With ordinary luck Mr. Scott expects to reach the coal in August. In the meantime, Mr. Samuel M. Robins, superintendent of the company, is perfecting arrangements for the rapid construction of the line of railway to Departure Bay and the loading wharves at Harwood Point and opposite the old Newcastle mine. As the majority of our readers are aware, this shaft is situated about four miles from the city and near the Wellington road and E. and N. Railway track, with the prospective Nanaimo Powder Factory in the near vicinity.

Work will be immediately resumed at the Monarch mine at Field, the owners of that property and the smelter at Vancouver having placed both mines and smelter in charge of L. D. Davis. This means business, for Mr. Davis is a thoroughly practical man. A number of men are working on claims adjacent to the Monarch, and Field is again showing signs of liveliness.

Reports are in circulation of rich placer finds on the headwaters of Bull River and over near Enderby. In fact, there is quite a stampede to the latter diggings, they being reported to be worth \$30 a day to the man.

On Porcupine Creek, the Discovery Company is making more than wages, and the Elsie taking out nuggets of as high value as \$15. The foreman of the latter is beginning to have a better opinion of the Elsie ground. The Donald Company has had some trouble with water in sinking a shaft, but now have it under control, and the shaft is going down at the rate of four feet a day. The French Company has everything in readiness, as soon as a pump arrives from Victoria, to begin pumping the water from its shaft, which is down over 35 feet.

A number of prospectors who left Donald intending to take in the country between the headquarters of Quartz creek and the north fork of the Spilimichene were turned back by the forest fires which are raging over in that section. They will make another effort by going in by way of the new McMurdo trail.

Coal Mining in Nova Scotia.

(Continued from June issue.)

work, and its strength and durability recommend it for mines having extended and irregular air ways. The Capel fan, which is highly spoken of, has not yet been introduced here.

The seams of the Cumberland and Cape Breton districts are very free from gas, it having been met in appreciable amounts only in the Springhill, Sydney and Caledonia collieries.

Still, reasonable care in systematically carrying the air through the workings is needed to prevent dangerous accumulations. Paradoxical as it may seem, mines giving off a small but steady amount of fire damp require constant watchfulness on the manager's part, as the employees do not bear in mind that their enemy, although easily routed, seldom omits to avail himself of any forgetfulness. Open lights and powder are used in all these mines.

In the Pictou district the seams are decidedly fiery, and much care is given to ventilation. They are as far as possible divided into separate districts for ventilating purposes, and in all, safety lamps are more or less used, and the use of gunpowder either guarded by appointing men to fire the shots, or in special cases prohibited.

TABLE SHOWING PRINCIPAL MECHANICAL VENTILATORS.

PUMPING.

The seams of the various districts may be considered as not carrying large amounts of water. In the Springhill district three seams, lying close together, are worked with a steady extraction of pillars, under a roof carrying several beds of porous sandstone, and a heavy surface cover, and these conditions cause a heavy pump charge.

In the Pictou district the overlying measures are shaley and compact and pass little water, and at a depth exceeding 700 feet the workings are dry and dusty. In Cape Breton nearly all the mines are above the dry zone, but they are not very wet. In the Sydney mine workings there

is little water, the submarine workings being remarkably dry. At this colliery a large amount of water from the old workings has to be handled. The pump is a direct acting Cornish one, the dimensions being given in the table of Cape Breton pumps, working through two lifts, the low set 335 feet, the staple set 350 feet, total lift of water to delivery drift from pump being 668 feet. The same was noticed in the "Lingan" submarine workings. Under the Mines Regulation Act, submarine seams having a cover of less than 500 feet must be worked in panels, and approaches cannot be driven under a cover less than 100 feet thick.

At several of the Cape Breton mines the pit waters are decidedly acid, and necessitate phosphor bronze and other patent linings, etc., for the working parts of the pumps.

At the Gowrie mines, Mr. Chas. Archibald has had much trouble in countending against corrosive effects of the pit water. The pumping shaft is 200 feet deep, and is divided into two bucket lifts. It was found necessary to use babbitt metal lining for the working barrels, and iron and brass and gun metal shells, falis, etc.

As the water grew more acid from running over the small coal and stone in the bords, as the workings extended, it was found that pump rods, pumps, nuts, etc., were very quickly eroded. Finally wood pumps were used, and the straps, clamps, flanges, etc., protected by layers of tarred flannel. Similar precautions were taken with the rods, and finally the bucket doors and clack pieces were made of wood instead of iron. Mr. Archibald gave an interesting account of this matter in the Transactions of the North of England Mining Institute. The writer published some years ago a paper on the Nova Scotia pit waters, from which he gives the following analysis as serving to show the composition of some of these acid waters.

Block House mine, Cow Bay; Analyst, Geo. Suv. Canada, 1872-73. Suspended matter.

From these tables it appears that in the year 1885, 1,352,205 tons of coal were raised, and that during the same period 3,646,889 tons of water were pumped—or nearly three to one. This estimate of the relative amounts of coal and water extracted has seldom been made over so large a district, and is interesting for reference beside the enormous tonnage of water to ore in many metal mines. It should, however, be remembered in considering these results that much of the water is from old workings, and forms a permanent duty. At the Sydney mines the present workings make little water, and the pumps have to handle the seepage of the acreage resulting from a century of mining and pillar working. At the Albion Colliery the pump duty represents in a similar manner the water of the underlying seam, as well as of the old workings in the thick coal which broke the roof

for many feet. Here the main shaft of the workings furthest from the dip has been selected for pumping. The work is performed by substituting for the two cages, two tanks each 8 ft. 6 ins. by 3 ft. 3 ins. by 5 ft., which automatically open on entering the water, and by engaging with a lever at the top of the shaft discharge without any attention. The tanks are raised and lowered by the winding engine at an average rate of 600 trips per day of 20 hours, which is equivalent to about 520,000 gals.

The pump at the Acadia Colliery is one of the best in use in our coal mines. The lift is one of the heaviest single lifts in America, and the following note will be of interest.

The mine is opened by a slope 2400 feet long, vertical depth 1000 feet. The pump is a Knowles of the duplex compound condensing type, with high and low pressure cylinders, 12 and 22 in.

in diameter, 24 in. stroke with four $5\frac{1}{2}$ inch plungers working against a head of 435 lbs. per square inch. The column is six inches in diameter, of wrought iron, the air chamber is 30 by 15 inches, the steam pipe 2600 feet long and four inches in diameter, takes the steam from Babcock boilers on the surface, at a pressure of 105 pounds. The pipe is protected with an insular earth jacket, the material being taken from a local deposit. After four years service this pump has given no trouble, and no joints have leaked. There is no suction on the pump, the lower valves being below the level of the water. The pump usually makes 10 double strokes a minute, but could run 25 strokes, equal to 100 feet piston speed a minute. A small hydraulic ram will raise the water from the lower level to the pump.

† Coal only.

‡ Gross weight.

§ Net load.

Expansion in the steam pipes is guarded against by U pieces. The pump stands in a house lined with brick, and having a cement floor.

The appended table shows the winding engines at the principal collieries, above and below ground. They are generally direct acting for shaft work and geared 3 to 1 for drawing through slopes. As fuel forms a small item in the expense of raising coal, low pressure and simple engines are in use. The economy is more apparent than real, and compound engines with the lessened wear and tear of boilers would prove more satisfactory. The speed in the shafts is low owing to their comparative shallowness. In the slopes the speed is practically limited by the rate at which the empty tubs can run safely down the incline.

At many of the deeper slopes the men are raised in long tubs, holding from one to two dozen, with extra couplings, and a trip bar, or "durkey" at the end of the last tub.

At the Intercolonial colliery the coals are drawn up the slopes, dipping at an angle of 15°, 1,800 feet long, the gross weight being 11,400 lbs. in the space of 1 minute and 50 seconds, and the empty tubs are lowered by brake in one minute.

The tubs hold from one-half to one and a quarter tons of coal. The wheels are made with fast or loose axles, and vary in diameter from 10 to 12 inches. The gauge of the tracks is from 2 ft. to 2 ft. 8 in.

The following table will show the tubs used at the principal mines:—

A TABLE of the dimensions of pit tubs in use at the principal collieries:

NAME.	Track Gauge.	Dia. of Wheels.	Wheel Base.	Height above track.	Width.	Length.	Height.	Capacity.

Boilers.—In Cape Breton the boilers used for supplying steam to the pumps and winding engines are generally plain egg ended and cylindrical. Their dimensions vary in length from 20 to 37 feet, in diameter from 3 to $5\frac{1}{2}$ feet. The working pressure varies from 30 to 50 lbs.

In Pictou and Cumberland there is a greater variety seen. At the Acadia colliery four Babcock boilers, running at a pressure of 105 lbs., supply the fan and underground engine and pump.

At the Vale colliery Lancashire and tubular boilers are used. At the West Slope, Springhill collieries, two Galloway boilers, 7 by 30 ft., form part of the battery. At several mines the plain egg ended boilers are used with pressures varying from 30 to 55 lbs. The consumption of coal, part round and part slack, used for stationary and locomotive engines, during the year 1887, was about 139,777 tons.

Transportation.—The various collieries are provided with railways varying in length from one half to thirty-seven miles for shipment of coal. The longest line in operation is that of the Cumberland Railway and Coal Company, who carry coal four miles to the Intercolonial Railway and thirty-three to Parrsboro on the

Bay of Fundy. The latter line is at present operated principally for general passenger and freight business, but it is expected that when their shipping facilities are completed much of their coal will find an outlet to St. John, New Brunswick, and the United States, via Parrsboro. The same company are now building towards the Gulf of St. Lawrence to obtain an outlet at Pugwash, so that they can secure water transportation to Quebec and Montreal during the summer months. A branch line ten miles long from Macan, on the Intercolonial Railway to the Joggins shore runs along part of the outcrop of the northern edge of the Cumberland coal field. It has been opened this year, and promises to develop several valuable coal seams.

The Pictou collieries are connected with shipping piers in Pictou harbor, and with the Intercolonial Railway by short branches which they operate with their own engines and cars, using the Government rolling stock when shipping over the Intercolonial road. In Cape Breton the Sydney mines ship at North Sydney, while the Victoria, International, Reserve and Bridgeport collieries ship at piers on the south side of the harbor. At Glace Bay, a brook emptying into the Atlantic, has been dredged into a spacious dock, capable of holding half a dozen large steamers and twice as many square rigged vessels. This dock was originally made through the enterprise of the Glace Bay Coal Company, but the Caledonia Coal Company have recently utilized it for shipping coal. At Cow Bay the Gowrie mine coal is shipped at a pier protected by the Government breakwater. The railway now being built through the Island of Cape Breton will, it is expected, be extended so as to connect all the principal mines with Sydney harbor, and ultimately to reach Louisburg harbor, so that during the summer, the busiest season, two outlets will be available, while the lessened winter trade can be accommodated at Louisburg. At present the cost of maintaining roads from one to eleven miles in length, with the rolling stock equal to a shipment of 2,000 tons a day, for summer shipments only, forms a heavy charge.

The various colliery roads and their equipments call for no special notice. The locomotives are of English and American types, the cars carry from four to six tons, and empty below. At the Sydney mines effective service is rendered by a locomotive built in the Company's shops, the frame, axles and tyres only being imported.

The locomotives vary in power and weight up to a Baldwin 50 ton freight engine. The roads are largely laid with steel rails, and are kept in very fair order. The only road calling for any special notice is that of the Sydney and Louisburg Coal Company. This road runs from Sydney to the Reserve mine a distance of eight miles, and ten miles further to the colliery at Schooner Pond, formerly operated by the company, and extends to Louisburg harbor, making in all 32 miles. At present the line is working only from Sydney to the Reserve colliery, the rest having been closed during the late depression in the coal trade. It is expected, should the trade continue to improve as it has for the past few years, that operations will be resumed on the Schooner Pond Branch, and the shipping piers at Louisburg be again utilized.

The road is well built and ballasted. Its gauge is three feet, with maximum grades of 1 in 100 against, and 1 in 75 with the traffic. The nature of the country has permitted a nearly a straight line with a minimum of curvature. In addition to two ordinary tank locomotives, it is equipped with three Fairlie double truck

locomotives, 25 tons loaded weight, with 11 inch cylinders, 19 inch stroke, and 3 feet 3 inch wheels. About forty trucks, holding four tons each, make a train.

These locomotives have done very good work, but it is a question if this pattern of engine on a narrow gauge road will prove as effective in winter as one of American pattern on the standard gauge, as they are not so handy in snow, and have very little clearance.

The wharves for coal shipments are all of wood, usually constructed with blocks and lines of piling. The cheapest form is that of a long pier with shoots on each side. In some cases a fall is given to a central track for the loaded cars to run towards the end of the pier, and are reverse grade for them to pass back to the shoots and return empty. In other wharves the loaded and empty cars are moved by horses. Where a level pier top is adopted, a system of ropes with hydraulic capstans would be found quicker and cheaper than horse-power.

The pier of the Sydney and Louisburg Railway, as described in the report of the Geological Survey, may be taken as a type of the most approved wharf. This structure, at the terminus of the railway in the town of Sydney, is a handsome and substantial structure, 620 feet in length, and 40 feet wide, with 36 feet of water at the end at high tide (the rise and fall being about 4 feet). The top of the pier standing 24 feet above high tide level is furnished with four tracks and seven loading shoots, and four traversing tables. The wharf is built upon very long and stout piles of Baltic timber, creosoted, and suitably braced by caps, ties and trusses. The superstructure is of native timber of good quality, and strongly framed. The cost of the wharf is given at about \$20,000.

The creosoting has proved an effectual preservation against the ravages of the teredo, and the piles, except a few imperfectly impregnated are in good condition at the end of fifteen years. The author is not aware of other applications of of chemically prepared timber for this purpose in Nova Scotian wharves. Reference has been made to the very acid water pumped from the Gowrie colliery. This water runs into the sea alongside their shipping pier, and, it is said, exercises a very decided effect in preventing damage from the naval borers, etc.

(To be continued.)

Interesting Electric Pumping Plant at a Scotch Quarry.—There is now at work near Linlithgow, Scotland, an electrical installation for pumping water which has some very interesting features. The motor and pump are situated at Kingscavil Quarry, near Linlithgow, where they raise water to a reservoir at a height of 135 feet, the water being forced through a distance of 600 yards of two inch pipes. The quantity of water raised has not been stated, but the pumps are double acting plungers at 2½ inches diameter, designed to work at about 40 revolutions to the minute. The dynamo is situated in the engine room of the Linlithgow Oil Co., at a distance of fully a mile and a quarter from the quarry, so that the power is transmitted electrically over 4,000 yards of cable. This not being an underground case, the cables are naked and are carried by insulators on telegraph poles. The E. M. F. at the dynamo terminus is 250 to 300 volts, and the current 11 to 12 amperes, the output being thus about 3,000 Watts, or about 4 h. p., and a

margin of 30 to 40 per cent. over present requirements has been allowed for future use. This is a small installation, but will serve as a demonstration of what can be accomplished. It works satisfactorily, and requires no attendant at the pumping house at the gangway.

General Mining.—Accounts to December 31 submitted in April, but an interim meeting is held in November. Dividend for 1884, 5 per cent; for 1885 and 1886, 3½ each year; and for 1887, £4 13s. 9d. per cent. Reserve fund, £20,850.

Low Point.—The vendors' shares, up to the end of 1888, do not rank for dividend until 7 per cent. per annum dividends have been paid on ordinary. Accounts to Dec. 31. For 1887, 5 per cent. was paid on the ordinary shares other than those held by the General Mining Assoc., that Company foregoing their dividend rights.

North Western Coal.—The deferred shares receive on dividend until 15 per cent. per annum (cumulative) has been paid on the ordinary. Accounts to June 30. Dividend for 1887-8, 5 per cent.

Sydney and Louisburg Coal.—Accounts to Dec. 31 submitted about May. Out of the profits of 1884 one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,574.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200. Reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £450,000; purchase consideration, £400,000, in cash or shares. Fully-paid shares issued to the vendor; partly paid to the public.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital of £100,000, of which £80,000 was the first issue. Most of the shares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1885. Accounts to October 31 submitted in March. No dividend yet. Debentures, £3,450. Reports are not obtainable, but this information is official.

Anglo-Canadian Phosphate.—The preference shares rank first for 7 per cent., and after a like rate has been paid on the deferred shares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £2,576, which was carried forward.

White's Asbestos.—Registered April 9th, 1889. The authorized capital is £100,000; first issue, £60,000, of which £20,000, fully paid, was issued to the vendor.

Manitoba and North-West Territories.

Notice of application for incorporation under the provisions of the Companies Act is made by The Anthracite and Bituminous Coal Company, Limited. The chief place of business of this new concern will be at Toronto. The capital stock will be \$250,000 in shares of \$100 each. The applicants are: B. E. Chaffey, Winnipeg, barrister-at-law; William Hamilton Merritt, Toronto, mining engineer; Frank A. Manning and Sanford Hall Fleming, Ottawa, civil engineers, and George F. Harman, Toronto, barrister-at-law, and who are to be the first or provisional directors of the said company.

A sample from the mine owned by the Cariboo Creek Mining Company was sent to the Selby Smelting & Lead Co. of San Francisco for a test. The return gave the value of the ore as \$18 in silver and \$32 in lead, the smelting company stating that it was worth \$27.20 a ton in San Francisco, but that it contained too much lead to enter the United States duty free.—*Truth.*

Experts have lately visited the Beaver and Queen mines, Port Arthur District, in order that the best of evidence may be had by the owners of those properties.

MONEY ORDERS.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion; also in the United States, the United Kingdom, France, Germany, Italy, Belgium, Switzerland, Sweden, Norway, Denmark, the Netherlands, India, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4	2c.
Over \$4, not exceeding \$10	5c.
" 10, " "	20c.
" 20, " "	40c.
" 40, " "	60c.
" 60, " "	80c.
" 80, " "	100c.

On Money Orders payable abroad the commission is:

If not exceeding \$10	10c.
Over \$10, not exceeding \$20	20c.
" 20, " "	30c.
" 30, " "	40c.
" 40, " "	50c.

For further information see OFFICIAL POSTAL GUIDE.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

NOTICE

Is hereby given that all communications in respect to matters affecting the Department of Indian Affairs should be addressed to the Honorable E. Dewdney as Superintendent General of Indian Affairs, and not as Minister of the Interior, or to the undersigned. All Officers of the Department should address their official letters to the undersigned.

L. VANKOUGHNET,
Deputy Superintendent-General
of Indian Affairs.

Department of Indian Affairs,
Ottawa, 15th May, 1889.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Coal, Public Buildings," will be received until Friday, 2nd August next, for coal supply, for all or any of the Dominion Public Buildings.

Specifications, form of tender and all necessary information can be obtained at this Department on and after Tuesday, 9th July.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon so to do, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order.

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 3rd July, 1889.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most
Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the
following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter
with original bores of 3 and 3½ inches,
bushings to be used for intermediate sizes;
larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.

22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to **THE DODGE WOOD SPLIT PULLEY CO., TORONTO.**

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed, we can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALI,
Commissioner.

January, 1889.

PROPERTIES FOR SALE.

Parties having developed or undeveloped mineral lands for sale will find the REVIEW an admirable medium for bringing them before the notice of CAPITALISTS and INVESTORS in GREAT BRITAIN and the UNITED STATES.

Intercolonial Railway OF CANADA.

The direct route between the West and all points on the St. Lawrence and Baie des Chaleur, Province of Quebec; also for New Brunswick, Nova Scotia, Prince Edward, Cape Breton and the Magdalene Islands, Newfoundland and St. Pierre.

EXPRESS TRAINS leave Montreal and Halifax daily (Sunday excepted) and run through without change between these points in 30 hours.

The Through Express Train cars of the Intercolonial Railway are brilliantly lighted by electricity and heated by steam from the locomotive.

New and Elegant Buffet Sleeping and Day Cars are run on all through Express Trains.

The popular Summer Sea Bathing and Fishing Resorts of Canada are along the Intercolonial, or are reached by that route.

CANADIAN EUROPEAN MAIL AND PASSENGER ROUTE.

Passengers for Great Britain or the Continent by leaving Montreal on Thursday morning will join Outward Mail Steamer at Rimouski the same evening.

The attention of shippers is directed to the superior facilities offered by this route for the transport of flour and general merchandise intended for the Eastern Provinces and Newfoundland; also for shipments of grain and produce intended for the European market.

Tickets may be obtained and all information about the route, also Freight and Passenger rates, on application to

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The Regulations also provide for the manner in which land may be acquired for milling purposes reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:—"Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

**ONTARIO
Mining Regulations.**

The following summary of the principal
provisions of the General Mining Act of
the Province of Ontario is published for
the information of those interested in
mining matters in the Algoma District,
and that part of the Nipissing District
north of the Mattawan River, Lake Nipis-
sing and French River.

Any person or persons may explore for
mines or minerals on any Crown Lands
surveyed or unsurveyed, not marked or
staked out or occupied.

The price of all lands sold as mining
locations or as lots in surveyed townships
is two dollars per acre cash, the pine timber
being reserved to the Crown. Patentees
or those claiming under them may cut and
use such trees as may be necessary for
building, fencing or fuel, or for any other
purpose essential to the working of mines.

Mining locations in unsurveyed territory
shall be rectangular in shape, and the
bearings of the outlines thereof shall be due
north and south, and due east and west
astronomically, and such locations shall be
one of the following dimensions, viz: eighty
chains in length by forty chains in width,
containing 320 acres, or forty chains square,
containing 160 acres, or twenty chains in
length by twenty chains in width, con-
taining 80 acres.

All such locations must be surveyed by
a Provincial Land Surveyor, and be con-
nected with some known point or boundary
at the cost of the applicant, who must file
with application surveyor's plan, field notes
and description of location applied for.

In all patents for mining locations a
reservation of five per cent. of the acreage
is made for roads.

Lands patented under the Mining Act
are free from all royalties or duties in re-
spect to any ores or minerals thereon, and
no reservation or exception of any mineral
is made in the patents.

Lands situated south of the Mattawan
River, Lake Nipissing and French River
are sold under the Mining Act at one
dollar per acre cash.

Affidavits showing no adverse occupa-
tion, improvement or claim should ac-
company applications to purchase.

A. S. HARDY,
Commissioner,
Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or
to work Minerals on any of
their Mining Lands and
Mineral Reservations,
Covering nearly a

Quarter of a Million Acres

In Eastern Ontario, and principally

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter
with original bores of 3 and 3 1/2 inches,
bushings to be used for intermediate sizes;
larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.

22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to THE DODGE WOOD SPLIT PULLEY CO., TORONTO.

MONTREAL.

A PERFECT FOOD

This statement is made upon the results of scientific analyses by the best chemists in the world. FRANCIS WYATT, Ph. D., Analytical Chemist, New York, after giving an exhaustive analysis, says:—"Here we have the whole of the elements, without a single exception, necessary for the formation of flesh, muscle and bone."

JOHNSTON'S FLUID BEEF

Is not a mere meat extract or a concentrated decoction, but simply fluid beef, containing, besides the albuminoids and gelatinoids, the correct proportion of those phosphates so essential to the support of life."

Victor Electric Fuses.

Superior to all others for Exploding any make of Dynamite, High Explosives, or Gelatine Powder. Each Fuse is tested and warranted extra strong and waterproof. Low grades of Dynamite Powder will do ten per cent. more execution if detonated with Victor Electric Fuses.

VICTOR BLASTING MACHINES.

Latest improvements, made in three sizes, easy to operate, strong and durable. No expensive repairs, low in price, will fire any make of Electric Fuses.

Canadian Syndicate Limited.— This syndicate was registered in London on the 3rd inst., with a capital of £20,000, in £1 shares, 200 being founders' shares, to acquire lands and heritages, coal, iron and other mines and industrial properties in Canada. The number of directors is not to be less than two nor more than five; the subscribers are to nominate the first; qualification, 100 shares; remuneration, £200 per annum and five per cent. on any dividend, to be divided as they may determine.

Powdered Coal in Place of Natural Gas.—Erastus Wiman and others are experimenting with a new process of heating iron with powdered coal instead of natural gas. The experiments are being conducted at the Vesuvius Iron Works, Pittsburg, and are said to be satisfactory. Speaking of the test, Mr. Wiman said: "It is yet rather limited in its scope, but eminently satisfactory in its results. One heat consumed 684 pounds of pulverized coal. The quantity of iron heated by that quantity of fuel was 4,600 lbs. We are confident, from the present results, that we can heat iron at 50c. per ton, including the cost of pulverized coal, while the existing rates for natural gas at the different mills make the cost of heating iron upwards of \$1 per ton. While a contrast test was not attempted, the lack of facilities necessary for the perfect operation of the new experiment rendered the test successful in only a limited degree, but sufficient to prove that we can produce the same quantity of iron with the pulverized coal process in an hour as the natural gas facilities at present afforded can produce in two hours. Of course, while the tests thus far have proven satisfactory, unforeseen difficulties may arise in the future, although we feel confident of success in a very short time." The tests will be continued in order to remove all doubts as to the success or failure of the plan.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

Vol. VIII. AUGUST, 1889. No. 8.

Tenure of Nova Scotia Mineral Lands.

The policy of the Province of Nova Scotia with regard to its mineral resources has been somewhat different from that adopted in other parts of the Dominion, and it has many points recommending it to the attention of the mining public, as well as to the Crown Land Departments of the Local Governments. Here the interests of the individual have been consulted equally with those of the government which derives an important revenue from Crown minerals.

The early land grants were made to three classes of people—Individual Settlers, Emigrants arriving in a body, and receiving through Commissioners, lots included in one grant or patent sometimes covering 125,000 acres; and wealthy individuals who were able by money or influence to secure grants sometimes as large as 20,000 acres. The names of men prominent in the early history of the country in this way became attached to numerous localities, as in the case of the DesBarres, Wilkins, Wentworth, Franklyn and other grants.

Land grants made previous to 1759 do not appear to have had any minerals reserved to the Crown, unless perhaps the royal metals were reserved even if not specifically mentioned. After this date usually gold, silver, precious stones, *Lapis Lazuli* were reserved, and after 1764, lead, copper and coal were added to the list. In some large grants, however, aggregating several millions of acres, made about this time only gold, silver and coals were reserved. After the year 1809, iron was added to the list of reserved minerals. The importance of reserving the coal in Cape Breton was recognized at an early date. In 1784 when the Island was first created into a separate province upon the recommendation of Governor DesBarres, an Order-in-Council was passed at St James, that in all grants of land a reservation should be made "of all coals, and mines of gold, silver, copper and lead which may be discovered in such lands."

In 1825, George the Fourth, by an exercise of the royal prerogative, gave his brother, the Duke of York, a lease of all the reserved minerals of the Province (including Cape Breton) for sixty years. However, in 1853, arrangements were made by which this lease was terminated on conditions advantageous both to the Province and to those holding under the Duke of York's lease. By an Act passed in the last named year, the Province relinquished

to the land grantees all the minerals previously reserved except gold, silver, lead, copper, iron, tin, coal and precious stones, and all other minerals, including limestone, gypsum, slate, clay, etc., are the property of the grantees. And all grants since that date have been in uniformity with that statute.

Two minerals only of importance have since been discovered and worked, viz., antimony and manganese ores, which, under the Act, are the property of the owner of the soil and pay no royalty. As large areas of Laurentian rocks are known in Cape Breton, it is possible that phosphate may be added to the list of fee simple minerals. From the standpoint of the Provincial revenue, it is to be regretted that iron ore was not reserved at an earlier date, as many of the large township grants in the Annapolis Valley, Cobequid Mountains, and elsewhere, contain important deposits of this metal, which have been largely worked at Londonderry.

The principle adopted with respect to these reserved minerals over one hundred years ago—that of never selling, but only leasing on short renewable terms—has been steadily maintained. The fact that this policy was adhered to at times when influence and favoritism ruled the day, may have been due to the custom adopted in England of letting the Crown minerals on royalties. The early lettings of coal in the Province were on short terms, from two to six years, at exorbitant royalties, sometimes as high as a dollar per Chaldron.

Upon the termination of the Duke of York's lease in 1858, when the mineral lands were thrown open, it was decided that licenses to search for minerals other than gold covering five square miles should be granted; out of which, within one year, an area of one square mile could be selected for mining. Upon the commencement of effective mining operations, the licensee was entitled to a lease for twenty years, renewable three times, provided that at the end of each term he was mining and complying with the conditions of his lease. Leases of gold areas are for a term of twenty-one years, and many contain any number of areas 150 by 250 feet; and as they are laid off in regular ranges, no ground is lost by the Government, and the individual miners' boundaries are readily ascertainable. In the same manner, the coal areas present regular outlines, a matter of importance, as coal can be mined in larger quantities, and more cheaply, than from the seams lying under fee simple properties, presenting every irregularity of boundary. The adoption of the principle of having the boundaries prolonged vertically on all sides of the leases frees the miner from the "law of the apex" and the inevitable crop of lawsuits, so prominent a feature of precious metal mining in the United States.

In order to facilitate business, the Nova Scotia Mines Department has been made a court of registry of all titles, transfers, etc., of leases and licenses of Crown minerals, free of cost. Any transfer, etc., of mining title in any part of

the Province is registered at the Departmental office, and is equivalent to the county registration, as in the case of land titles. The Crown having reserved the minerals, has secured to all lessees the right of taking land for the purpose of mining; failing a friendly agreement with the owner of the soil, the miner can obtain by arbitration the surface soil necessary for his works. At present revenue is received only from coal and gold. In the case of the former, sworn quarterly returns are made by the lessee of the amounts of mineral sold and of the labor performed. In the case of the gold mines, licenses are issued to parties building quartz mills, who are placed under bonds to place royalty on all the gold they extract. While the lessees make sworn returns direct to the Department of his labor and the number of tons sent to the mills.

When the monopoly of the Duke's lease ceased in 1858, and the coal lands were opened to the public, it was considered that leases should contain as conditions a royalty of about 10 cents on every ton of round coal sold, and stipulations for effective and continuous working, a non-compliance with which rendered a lease liable to summary forfeiture. The lessee of a gold ore was, under like penalties, required to perform annually a certain number of days' labor.

Practically speaking, no government could deal in so summary a manner with defaults in carrying out the lease conditions to the letter, as many extenuating circumstances could be alleged, such as fluctuations in trade, litigation, etc. Nor could the Mines Department be allowed to exercise a discretion as to cancellation of leases, as those aggrieved by its decisions would be ready to complain of harsh treatment. The remedy for the difficulty was the admission of the general public as a party of the third part, and for many years forfeitures have been made acceding to a prescribed procedure in the requisition of any person desiring possession of an area not being worked. The government of course reserving its right to act of its own motion in questions of royalty, etc. At another time it may be pointed out how this system worked, though steps have been taken to prevent harassing forfeitures, and to maintain a balance between legitimate mining and speculation.

The Ottawa and Gatineau Valley Railway.

An enterprise of no secondary importance has now taken practical shape, is about to proceed, and will be prosecuted energetically. We refer to the Ottawa and Gatineau Valley Railway, a line which commences south of the Gatineau railway bridge, and proceeds along the river to the well-known Gilmour mills at Chelsea; thence to the Pêche, still hugging the water course; thence to Kasabazua, and on to the Desert. The Gatineau Valley road has had a

hard struggle, but now, with a cash bonus of \$10,400 per mile and 6,000 acres of land per mile, there will be no trouble found in financing it. The subsidies given by the Dominion and Provincial Governments are a fair criterion of the public estimation in which this railway is held; it is an acknowledgment of its utility and advantages. The line will open up a great mineral, agricultural and timber country, and prove a source of great convenience to the traveling community, as up to the present time the old stage coach has to do what modern appliances perform with so much more speed and acceptability. We look to new life and an era of marvellous progress along the Gatinco so soon as the line is completed. The President is Mr. H. J. Beemer, of Montreal, and the Vice-President, Mr. C. H. MacIntosh, of Ottawa.

Artificial Fertilizers.

By Francis Wyatt, Ph. D.

Chemistry may be described as that branch of science which investigates into the nature and properties of the elements of matter, and determines the manner in which they react upon, and combine with each other. If we hand over a grain of wheat to the botanist, he can discern in it nothing but a tiny, yellow, opaque and brittle seed, whereas, if we pass it to the chemist, he will discover by analysis that it is composed of a woody fibre, starch, gum, sugar, fat and protein. Again; ask a geologist to examine the soil, and he will designate the different ages to which it belongs and the various rocks from which it is derived, but, without the chemist, he is unable to determine the nature of its constituents, and hence cannot foretell, before any cultivation has been attempted, whether it is destined to be fertile, or of what kind of vegetation it is best able to promote the growth.

The application of chemistry to agriculture is thus naturally indicated; by its aid we obtain from the soil, from plants and from animals, at the lowest possible expenditure of time and money, the highest possible quantity of those substances indispensable to our physical well-being.

Production, in order to be cheap, must be rapid and plentiful, and we all know that the progress of unaided nature is methodical and slow.

Chemistry, by investigating the natural laws which govern the development of all living things, and by carefully observing the facts acquired by the practical experience of centuries, endeavours to provide the farmer with means by which he may assist and hasten the processes of nature. His work is, of course, still far from complete, but it has familiarized us with those elements which are essential to plant growth, taught us how those elements are distributed, shewn us what portion of them is or should be contained in our soils, and what soils are most propitious for different kinds of plants.

When our globe was launched into space, it was a liquid somewhat similar in consistency to molten glass, and, therefore, presented a vastly different appearance to that with which we are acquainted. It was made up of about sixty elementary bodies, so deposited, by order of weight or density, that the heaviest, such as gold, silver, lead and copper, were in the centre, while the lighter, such as calcium, aluminum and silicon, remained, and still exist, near the surface, where they have combined to form clays, limestones and sands.

Encircling its interior was a heavy, poisonous atmosphere, comprising all those elements which at a very high temperature assume the gaseous form—notably sulphurous, sulphuric, phosphoric, hydrochloric, nitric, boric and carbonic acids, with torrents of steam, and dense clouds of mercurial, antimonial, arsenical and other metallic vapors. When this mass began to cool, it probably resembled an immense glass ball, the solidified sides of which were uplifted by the bubbleings of the intensely hot liquid mass within. These solid projections formed our mountains, and, passing from the transparent to the opaque, they gradually assumed the crystalline form. What is known as the earth's crust must have resulted from an extraordinarily forcible action consequent upon the fall of temperature. The vapors already alluded to were condensed into rain. The rain dissolved all the acid bodies, and these acids, attacking the alkaline crust, combined with its most powerful bases to form various salts. These salts soon underwent decomposition; some—such as sulphate of lime or gypsum—were deposited, while others, principally the chlorides, remained in solution and formed the seas. The neutralization of the stronger and more corrosive acids permitted the weaker carbonic acid to develop its activity, and it is this acid which has continued to play the most important part in nature in our own times. Held in solution by the running waters, it attacked and dissolved the various bases which existed in such large quantities in the mountains, and deposited them in the form of carbonates in the still warm valleys. This process of saturation, or neutralization, being entirely accomplished, chemical equilibrium may be said to have become established; the period of great geological catastrophes, therefore, came to an end, and the temperature of the earth gradually sank below the boiling point. A few volcanic disturbances continued, it is true, to occasionally convulse it; there was the upheaval, splitting asunder and complete overthrow of the most gigantic mountains, the drying up and the division of seas, and the formation of lakes of both fresh and salt water. As the temperature continued to cool, however, these disturbances became more and more rare, and there then commenced that formation of the soil which gave rise to the phenomena of vegetation.

VARIETIES OF SOIL.

It is the general custom to class arable lands according to the nature of their predominating

constituents, and thus we allude to soils as sandy, clayey and limey.

Sandy soils are distinguished by their extreme porosity, and are frequently in such a fine state of division, that in the dry season the least wind will displace and scatter them in all directions. In such cases they are naturally sterile; but, when they are sufficiently moist, they facilitate and encourage the growth of an immense variety of plants of the lower order, which, by their eventual decomposition or putrefaction, form considerable deposits of that valuable substance called humus.

Such soils are more propitious than any others for the development of plants with very delicate or fine roots, such as barley, rye, oats, lucern, lupins, lentils and potatoes; but they require constant attention, and a large and regular quantity of manure, because their porosity permits them to absorb such an abundance of oxygen, that all their organic matter is rapidly burnt up.

Clayey soils are heavy and compact, and, when they contain more than fifty per cent. of pure clay, are onerous to work, and unprofitable to cultivate. It has, however, fortunately been discovered that the addition to them of so small a quantity as two per cent. of burnt lime suffices to so entirely change their nature and consistency, by transforming the silicate of alumina into a porous silicate and aluminate of lime, that it is now an easy matter in districts where lime is cheap and plentiful, to overcome this difficulty. In hot countries or in windy regions or in districts where the sub-soil is of a very permeable character, good clay lands offer great advantages, and although they periodically require the application of large quantities of reconstituents, they possess the faculty of retaining all the precious elements supplied to them, and of storing them up for the use of successive crops. When they contain a proportion of about ten per cent. of carbonate of lime, or chalk, they are the best of all soils for the extensive growth of such important plants as wheat, corn, clover, hemp, peas and beans, and of such trees as the chestnut and the oak.

Limey, or purely calcareous, are even lighter than sandy soils, and when, as is sometimes the case, they are very white and dry, they are absolutely barren. Such as these are, however, easily encountered, for we generally find them mixed with a sufficiency of clay to give them some degree of consistency, and render them available for ordinary purposes. Few soils are entirely devoid of lime, owing to the fact that all rocks contain it in greater or lesser proportion, and because it is transported in immense quantities by waters, in the form of bi-carbonate, and deposited. If it were otherwise, or if, in the absence of lime, other alkaline substances were not forthcoming, the acid principles secreted by all plants could not be saturated, and the inevitable result would be decomposi-

tion and death. In its pure form, however, lime is such an extremely strong base, that it is incompatible with life, and hence it is never allowed to exist in the soil, unless it be combined either with carbonic or silicic, or sometimes with sulphuric and nitric acids.

The general properties of every variety of soil are much influenced by colour; those which are white, and hence unable to absorb the solar rays, being invariably cold, whereas those which are dark are warm and fertile. In this regard both iron and manganese are of undisputed value, for by their transformation into ferric and manganic oxides, they produce the deep red or brown so much admired by sagacious farmers. In damp climates or in very moist soils, however, too much iron is apt to become a source of considerable danger, from the fact that, by the exclusion of air, the ferric is reduced, by its affinity for water, into ferrous oxide, and in that form exercises a highly corrosive action on vegetable life.

ELEMENTS OF PLANT LIFE.

Sixty years ago there was no such thing as what we now call scientific agriculture. In the old countries men were asking themselves the very question that faces us to day—how it is that lands which were once so fertile and productive now show signs of approaching exhaustion. The answer to this question could only be given after we had found how out-door plants live, whence they obtain their food, of what elements that food is composed; how it is conveyed to the plants and how they absorb it into their organisms. In point of fact the manner of life in plants is very similar to the manner of life in animals and man. They require certain foods in stated proportions which pass through the process of digestion; they must breathe a certain atmosphere and they are subject to the influences of heat and cold, light and darkness.

The tissues of their bodies, like ours, are composed of carbon, hydrogen and oxygen, and contain besides nitrogenous principles, certain minerals, such as phosphoric acid, lime, potash, sulphur, magnesia and iron. It will be seen at once that if it is necessary for us to constantly absorb a sufficiency of these self-same elements to keep up our normal heat and provide us with new tissue, it must be no less essential for plants to acquire similar food, for similar purposes.

Pure atmospheric air is a mixture of nitrogen and oxygen, with a small proportion of aqueous vapor, and about 4-10,000th of carbonic acid, while water is formed by the combination of two parts of hydrogen and one part of oxygen. It is therefore apparent that the principal organic elements of plant food exist in the atmosphere as air, water and charcoal, and may be absorbed from without by the leaves, while the whole of the mineral bodies in order to be found in the soil, should be taken up from within by the roots.

How plants absorb and elaborate the inorganic matter necessary to the food of those graminiferæ which afford to man the bulk of

his animal sustenance, or what process is undergone in the assimilation of carbon, hydrogen, oxygen, and nitrogen, which, in the form of carbonic acid, water and ammonia, or nitric acid, are taken from the air and the soil, we have no space to discuss; but, it will be interesting to quote a very beautiful and practical illustration of the contrast between them and ourselves, furnished by Dumas.

Vegetables.	Man and Animals.
Decompose Produce.	Consume
{ Nitrogenous Matter, Fatty Matters, Gum, Sugar, Starch.	{ Nitrogenous Matter, Fatty Matters, Gum, Sugar, Starch.
{ Carbonic Acid, Water, Ammonia.	{ Carbonic Acid, Water, Ammonia.
Evolve oxygen, constitute apparatus of reduction and are stationary.	Absorb, oxygen, constitute apparatus of oxidation and are locomotive.

The consideration of this remarkable contrast leads us to contemplate the progressive exhaustion of the soil, and the necessity for its reconstitution by the aid of chemistry, for, while admitting that *we produce those very elements* which the plants decompose, and which are so necessary to their existence, it is nevertheless a fact that *we are locomotives, and do not in practice give back to them what we have taken away.*

The elementary composition of plants being thus determined, the next step that suggested itself to investigators was the analysis of the soil, in order that comparisons might be established between virgin lands which had borne no cultivated crops and old soils which had long been tributaries to every kind of vegetable culture.

Briefly stated, it was found that good, ordinary young lands, contain in abundance most of the dominating ingredients discovered in plant organisms, and that soils which have long been under cultivation, and now show themselves incapable of their former remunerating production, only contain these dominants in minute proportions, or lack them altogether.

These data form the basis of our present science, and may be summed up in the following manner:

A. Plants require for their nourishment and prosperity a given quantity of food, composed in varying proportions and according to their different natures, of hydrogen, oxygen, nitrogen and carbon, and of phosphates, sulphates and chlorides.

B. The hydrogen and oxygen, in the form of rain or dew, are supplied as water, and the carbonic acid is mainly derived from the air.

C. Good virgin soils contain the whole of the necessary minerals, in addition to considerable quantities of nitrogenous and carbonaceous matter.

D.—Long-cultivated and non-productive soils may be termed exhausted, since chemical analysis proves their inability to furnish the needful substances in quantities equal to those found in the ashes of healthy plants,

FERTILIZERS AND AMENDMENTS.

Having arrived at this important stage of progress we understand that, if agriculture is to continue to be the basis of national wealth and prosperity we must find means of restoring to our soils, if not in a natural in some artificial form, the chief elements yearly taken away from it by our crops—we say *chief* elements because a great number of the necessary minerals are only required in very minute proportions, and therefore generally exist in sufficient abundance. We may consequently disregard all these, and devote our attention to nitrogen, potash, phosphoric acid and lime, since these not only play the most important part in the functions of vegetation but are the most liable to complete exhaustion. The following figures representing averages compiled from the official reports of the United States Department of Agriculture extending over a series of years, will be found very *à propos* for the purpose of illustrating the arguments already put forth.

ELEMENTS OF FERTILITY TAKEN FROM THE SOIL PER ACRE AND PER ANNUM, IN POUNDS.

—	Nitrogen.	Lime.	Phosphoric Acid.	Potash.
Wheat	25	15	30	45
Maize	55	45	80	40
Oats	30	14	18	20
Barley	35	12	18	20
Rye	25	13	25	35
Buckwheat	35	12	40	38
Hay	40	40	15	40
Tobacco	not calc'd.	160	not calc'd.	340
Turnips	do	100	45	150
Potatoes	44	60	52	185

These are, of course, only a few examples, but they will suffice for present purposes, and it is perhaps hardly necessary to add that if, according to the nature of the crop desired, at least a sufficient proportion of each of these essential elements be not present in the soil, the plants will languish, various malignant diseases will declare themselves, and death will inevitably ensue before they reach maturity.

Now, the practical question that must naturally arise, is, how may all this loss be repaired, and whence are all the elements needed to repair it to be derived? It is not so very long ago since this question would have been generally answered by the words, "farm-yard manures," and even to-day there are a large majority of farmers who depend exclusively upon this valuable fertilizer.

The fallacy of their policy is, however, made apparent by a simple calculation, which any interested reader can work out for himself, in this wise.

The necessary elements to the growth of a medium crop of hay have been put down, approximately, per acre, as:—

Nitrogen	40 pounds.
Lime	40 "
Potash	40 "
Phosphoric acid	15 "

The very best farm yard manure is found to contain, on an average, for every hundred pounds, exclusive of water and fibre :—

Nitrogen.....	not quite $\frac{1}{2}$	pound.
Lime.....	little more than $\frac{1}{2}$	"
Potash.....	about $\frac{1}{2}$	"
Phosphoric acid.....	(say) $\frac{1}{4}$	"

With a very moderate allowance for loss in storage, drainings, evaporations, etc., it must be conceded from these figures that to repay what has been borrowed from the soil by a single crop of hay would call for some six tons of material per acre; and there is probably only a very limited number of farmers—even if there are any—who could produce anything like this quantity. The practical answer to the question propounded, therefore, is that we must profit by the teachings of science and turn to artificial or chemical fertilizers as the only means of avoiding present loss and eventual poverty. This leads to a brief glance at the most accessible materials, and the forms in which they are most appropriate for the requirements of growing plants.

NITROGEN.

The sources and the supplies of nitrogenous elements, outside the free nitrogen and the ammonia that exist in the atmosphere, are numerous and plentiful. Every species of plant, roots, stalks, leaves and seeds yield it up in varying proportions, under the influence of decay. The refuse or waste from an average crop of clover contains about fifteen pounds of assimilable nitrogen per acre, and some of the other green crops are so rich in this element that it has become customary to occasionally grow them for the express purpose of plowing them under directly they have reached maturity. Outside the farm, we have guano, fish, wool rags, horns, hoofs, hair, blood and all other animal refuse from the slaughter-house, and, failing a sufficiency of all or any of these, there are the nitrates of soda and potash, and sulphate of ammonia.

The following are about the proportions of nitrogen contained in every 100 pounds of some of the foregoing materials :—

100 lbs. shoddy	contain	7 lbs. nitrogen.
100 " wool dust	"	9½ "
100 " dried blood	"	12 "
100 " rope cake	"	5 "
100 " cotton	"	5½ "
100 " sugar scum	"	3 "
100 " leather cuttings	"	8 "
100 " sul. ammonia	"	21¼ "
100 " nitrate of potash	"	13¾ "
100 " " soda	"	16½ "

POTASH.

We have seen that the quantity of potash absorbed by the most important of our crops is greatly in excess of phosphoric acid. It may consequently be assumed that continued fertility depends upon a preponderance of this important base. This, nature has in a great measure provided for, by promoting the continuous decomposition of feldspathic and other rocks, and by favouring the transfer of potash in the various forms of silicates, carbonates, and oxides from the subsoil to the surface.

When all these varieties fail, however, it is easy to secure inexhaustible supplies from the nitrates and chlorides, which are either deposited in various localities on the surface, or in the interior of the earth's crust, or held in solution by the waters of the sea.

Potash salts, to be readily assimilable, or useful to the plant, must be liable when introduced into its sap, to so easy a decomposition, that their liberated alkali may enter at once into the necessary combination with the organic compounds.

If, as it is applied, the potash be united to its acid by too strong a bond, the vegetable will be unable to effect a dissociation; and the salts will accumulate in the tissues, and become a mere burden instead of promoting healthy growth.

This question of assimilation, therefore, is one that demands very attentive study; and it is from the data collected by the most recent scientific discoveries in relation to the laws and powers of affinity, that the various salts, according to their adaptability, have been classed in the following order :

Carbonate,	Sulphate,
Nitrate,	Chlorides.

The amount of potash contained, in round figures, in each of these salts when pure is as follows :

100 pounds Carbonate contains 68 pounds of potash.

100 pounds Nitrate contains 46½ pounds of potash.

100 pounds Sulphate contains 54 pounds of potash.

With regard to the chlorides, which are compounds of chlorine and *potassium*, it is necessary before they can furnish anything available that they should undergo a preliminary decomposition in the soil, but it may be assumed that when this has taken place, every 100 pounds of the pure chloride would be equal to about 63 pounds of potash.

On the assumption that neither the sulphate of potash, nor the chloride of potassium is directly assimilable by plants, their efficacy must depend upon the composition of the soil under treatment, and the character of any other fertilizers with which they are simultaneously used.

To illustrate this it is only necessary to imagine a mixed fertilizer containing in suitable proportions, superphosphate of lime, sulphate of ammonia, and muriate of potash.

As soon as this compound reaches the soil, a reaction is commenced between the whole of the salts, resulting in the production of phosphates of ammonium and potassium, and sulphate and chloride of calcium.

The two latter will be washed down into the subsoil by the rains and carried away, while the two first will enter the roots, and be very readily decomposed in the sap, and utilized by the plant.

If, instead of the above, a mixture be chosen of nitrate of soda, and either the muriate or the

sulphate of potash, a similar transformation will take place; chloride or sulphate of sodium being produced on the one hand, and nitrate of potash on the other.

Dispensing with unnecessary reiteration, these typical examples sufficiently illustrate the importance and advisability of making preliminary trials upon a small scale, with each salt, in every case where the use of potash has been determined upon, since, under the varying influences of the different elements in every soil, uncertain and unlooked-for results may be obtained.

PHOSPHORIC ACID.

This indispensable fertilizing agent is probably the one in which all cultivated soils are most deficient, and, to make matters still more complicated, its occurrence though so plentiful in nature, is found to be most unequal.

It does not exist in the atmosphere; soils of the granitic and tertiary formations are nearly deprived of it; and many other species only contain it in very slight traces.

The following are the principal and most available commercial sources of phosphates for agricultural purposes, viz.:

First, Natural phosphates, of animal or mineral origin, such as bones, bone-ash, and apatites very finely ground.

Second, Superphosphates, manufactured by treating these raw materials with a sufficient quantity of sulphuric acid to transform them from an insoluble into a soluble form.

Third, Precipitated phosphates, obtained by dissolving raw phosphates in hydrochloric instead of sulphuric acid, and adding to the liquid a milk of lime.

From which of these forms the most direct advantage is to be obtained by the farmer, is a somewhat disputed question. Accepting the generally admitted and rational theory, that no element can penetrate into the interior of a plant unless it be in the form of solution, it naturally follows that preference will be invariably given to those commercial phosphates which are most readily subject to dissociation; and this will entirely depend upon two conditions :

(a) Their own degree of aggregation.

(b) The nature and composition of the soil in which they are employed.

The first thing to be obtained is undoubtedly a fineness of pulverization, which will so divide the molecules as to render them easily decomposable by the natural action of the elements contained in the ground, and in this only partial success has been achieved by mechanical means. So long ago as 1851, Leibig recognized the difficulty, and proposed, in order to solve it, to chemically perform this operation by manufacturing superphosphates.

From the standpoint of disintegration, this method has been entirely satisfactory, and has enabled agriculture to rapidly obtain results from the use of phosphoric acid, which would otherwise have been impossible. From a chemical point of view, however, the whole

theory fails. We know that superphosphates are only soluble in water so long as the sulphuric acid with which they have been manufactured retains its ascendancy over the lime, and that when they reach the soil, especially where carbonates are in abundance, the sulphuric acid is at once overpowered. The phosphoric acid, being unable to exist in a free state is taken up by the lime and iron and at once reverted to a tribasic form. In other words the whole question is one of time, and of dollars and cents.

The farmer buys a ton of raw phosphatic material finely ground, and containing say twenty-five per cent of phosphoric acid for \$10. If his land contains neither humus nor acid elements, nor a sufficiency of lime, the phosphate will not decompose and he will have to wait perhaps several years before obtaining any appreciable results for his outlay. On the other hand he buys a ton of superphosphates, containing only fourteen per cent. of phosphoric acid for \$20 and applying it to an exhausted soil, producing the desired results on his very next crop. Hence it is apparent that the phosphoric acid of the latter is more assimilable than that of the former case; and this assimilability can only be due to the absolute state of division insured by the series of decompositions to which the raw phosphate is exposed during the manufacturing process. To define with scientific accuracy the exact merit or intrinsic value of any specific phosphate, is a matter of very serious difficulty; since, besides that of its own physical conditions, so much depends upon the nature and composition of the soil in which it is to be employed. No better examples of this truth could possibly be found than the preliminary comparative experiments, conducted during the past two years, with raw basic slag, and various other phosphatic materials; for they have so far proved, that whereas, in some soils the effects produced by crude phosphates fairly rival those obtained with superphosphates, in other soils they are either quite inert or insignificant in their action.

LIME.

All farmers are familiar with the use of lime, but it is doubtful whether many of them know the exact reasons for its application or clearly understand its influence. It may therefore be broadly premised that the objects for which it is employed are two in number.

First. To exercise a chemical action upon the numerous constituents of the soil, and thereby produce a complete modification of its physical and chemical properties.

Second. To furnish it with the quality required by plants for their alimentation and growth. From the figures already given it will occur to the reflective mind that, regarded as a plant food, lime is of less direct importance from a commercial standpoint than either nitrogen, potash or phosphoric acid.

Placing the total quantity yearly removed by crops at an average of 50 pounds per acre a soil need only contain say, half of one per cent.

to supply all that could be demanded of it during several hundred years.

Its true agricultural value must consequently be attributed to its qualities as an *amendment* rather than a fertilizer.

The term "amendment" has been given to substances which, when they are applied to a soil, effect a change in its general constitution, and thus lime, when mixed into strong, stiff and unworkable clays in the proportion of from ten to fifteen tons to the acre, induces in them a far-reaching chemical decomposition, which, in addition to partially transforming them into the more porous silicates and aluminates of lime, sets free large quantities of alkaline salts that were previously unable to co-operate in the phenomena of vegetation because bound up in insoluble combinations.

This marvellous effect would of itself create for lime a very high place in the estimation of farmers; but it by no means represents the total scope of its usefulness, as will be clear to those who recall its properties as a generator and promotor of combustion. The accumulation of vegetable remains in various stages of decay and putrefaction, left in the ground by the crops or intentionally plowed under for the purpose, results in the production of a body known as humus. If left to itself this body would so acidify the soil as to destroy its normal basic or alkaline reaction. It could consequently no longer afford nourishment to any of those plants which generate the elements of animal food. In order to successfully cultivate such lands it is therefore necessary to neutralize their acidity; render them alkaline, and remove the excess of these organic matters.

All these conditions are perfectly fulfilled by burnt lime. The word "combustion" designates that process by which an organic body principally composed of carbon and hydrogen, with traces of nitrogen, unites with the oxygen of the air to form oxides. Thus, coal, coke, wood and vegetable refuse, although burnt to create heat, and apparently thereby destroyed, in reality merely undergo a chemical change, arising out of that scheme of nature which has provided for the restoration of all their constituents to the atmosphere and the soil.

The carbon continues with the oxygen of the air to form carbonic acid gas; the hydrogen and nitrogen, momentarily set free by this action, unite themselves together to form ammonia; while the ash consists of oxidized mineral matters.

With the exception of fluorine, every element combines with oxygen to form oxides, and in doing so develops more or less heat. The warmth of the animal body is created and sustained by the oxidation of the starchy or fatty or carbonaceous elements of food; and, hence, while animals breathe in oxygen, they breathe out carbonic acid, gas and steam. When this natural chemical process is stopped, the animal dies; or, to speak more forcibly, when no more food is provided, or no more oxygen

inhaled, the internal fire ceases to burn, and everything grows cold.

This is but a brief definition of combustion. It, however, suffices to establish that oxygen is the promoter of the phenomenon, and hence to explain that, if great masses of decaying humiferous matters sometimes linger in soils, it is because the latter are cold and wet and have become so choked up and cohesive as to preclude a proper circulation of air.

Oxygen is thus unable to reach them until they have been warmed, dried and made porous. Burnt lime, when properly administered, accomplishes all these objects.

By its great affinity for water and the intense heat of its combination, all moisture is absorbed. The rapidly drying soil cracks and opens up in every direction, and free ingress being thus afforded to the air, a vigorous and permanent combustion sets in.

Attacked in its turn by the carbonic acid gas resulting from the combustion process, it is converted into carbonate of lime, and, alkalinity being thus gradually restored, the plough completes the conquest, and barren wildernesses become fertile plains.

Reviewing these effects and briefly summing up its advantages, it will be seen that, independently of its power to impart porosity and to facilitate combustion, lime sets free various alkaline salts from useless combinations, and renders them available as plant-food. It also decomposes certain injurious salts of iron, magnesium and manganese, counteracts the evil influences of all kinds of sulphurous emanations, and, before being transformed into carbonate, destroys, by its causticity, vast quantities of ravaging insects and their eggs.

Despite these great advantages, it must be noted that the indiscriminate use of this powerful oxidizing agent on good ordinary cultivated soils would be productive of disaster.

Lest this statement be regarded as conflicting, it is explained that a good soil is what has been described as a mixture containing all the elements required for plant-food, in a proper physical condition, and with a due proportion of humus or organic matter. This humus is of the utmost importance.

First. Because, by its very slow oxidation or combustion it helps to maintain the warmth of the soil.

Second. Because it contains a considerable quantity of nitrogen, which is gradually transformed by this slow combustion into ammonia or nitric acid and nitrates.

Third. Because it has the invaluable property of always retaining moisture, and thus can enable plants to withstand periods of drought which would otherwise kill them.

However rich it may otherwise be, it has been demonstrated, by experiment, that no soil is perfect which contains less than two per cent. of humiferous matter.

This is why scientists untiringly urge upon farmers to provide for its maintenance by using

in addition to artificial fertilizers all the farm-yard manure they can scrape together and to carefully plough under, instead of burning, as they are so prone to do, all the refuse from their crops.

The imperative necessity of this duty is intimately connected with the most complicated problem yet remaining to be solved by agriculturalists, (i.e.) whence to obtain sufficient assimilable nitrogen to integrally replace what is taken from the soil by the crops, and exported with them to foreign countries every year, without having recourse to any of the costly commercial substances already enumerated.

The pet theory—so beautiful as a theory—of obtaining it directly from the air, in a suitable form, and at a fabulously cheap price, continues to occupy many clever brains in many scientific laboratories, but is still as far as ever from a practical solution; on the other hand since it has been proved that nitrification chiefly results from the extremely slow oxidation of organic matter in alkaline soils, it naturally follows that so long as there exists a sufficiency of humus under favourable conditions, no dearth of available nitrogenous plant food need be apprehended.

Unfortunately, the immense amount of exportation, combined with misconceived notions of sanitation, prohibit all hope of restoring to the lands the whole of the required nitrogen in an organic form. It is consequently all the more necessary to manipulate what remains in a spirit of economy; to handle the soil with delicacy, care and intelligence, and above all things, to avoid introducing into them any substance which may interfere with their normal, regular, and natural functions.

The White's Asbestos Company.

A meeting of White's Asbestos company was held in London on 1st inst., in opening which the chairman, Mr. W. M. Borradaile, said:—"Our company was registered on April 9, and our prospectus was issued on April 13. Before issuing the prospectus the board decided that they would not go to allotment unless 16,000 shares were applied for, as they considered that it was advisable that the working capital should be £10,000, and the cash payment to the vendors was £6,000. As a matter of fact, only 15,000 shares were applied for, but, on the vendors' agreement to take up a further 1,000 shares in the event of the directors calling upon them to do so, the board had no hesitation in going to allotment. The company having been formed, the engineer sailed for Quebec on April 25, arriving there on May 5. It took him about a fortnight to purchase his supplies and make the necessary preparations for commencing work, and on May 20 he arrived on the property. It will take a little time to develop this property to an extent which will yield large returns; but Mr. Boyd already reports a good show of asbestos on the face of his working, and we have every reason to be satisfied with the prospects which the work done so far holds out. In the last days of June Mr. Boyd made arrangements to commence work on a second property in Coleraine. In this mine, also, there is a good show of asbestos of good quality, and Mr. Boyd also reports a rich vein of soapstone ready for market. I am pleased to inform you, gentlemen, that the properties described in the prospectus have been duly conveyed to the company. Mr. Stuart, the Government Solicitor, having been our attorney in the matter. I may also mention that before coming home Mr. Boyd had selected several other properties, to the extent of about 500 acres, which will no

doubt be secured for the company at the Government price, which will probably not exceed £1 per acre. And now, gentlemen, I do not know that I have more to add; but as I have said, I shall be most happy to answer any question that may be asked. The asbestos mining, as regards Canada, is a comparatively new industry, having only become of importance within the last few years. It seems to be generally admitted that Canadian asbestos is superior in quality to that found anywhere else, and the demand for it is increasing rapidly, and is now in excess of the supply, as is evinced by the steady advance in price. Further developments will undoubtedly take place, but, so far as can be seen at present, good mines will continue to yield very handsome returns. These properties, gentlemen, were not selected in a haphazard way. Mr. Boyd has spent a considerable time over the matter, and made openings over 20,000 acres of ground before he bought the property."

The new Foxton Mining Company in Court.

Recently, in the Chancery Division of the High Court, before Mr. Justice Kay, Mr. Renshaw, Q.C. (with him Mr. Alexander) moved on behalf of the plaintiffs, Möller, Hunter and Lomer and the Foxton Phosphate Mining Company, Limited, for an injunction restraining the defendants, Maclean, Gay, Mew, Adams, Bingham and Langridge, from holding any meeting having for its object the removal of the plaintiffs from the directorate of the plaintiff company. The company was registered on April 18, with a memorandum of association, but no articles, so that Table A of the Companies Act applied. On the same, April 18, in accordance with Section 52 of the Act, the subscribers to the memorandum appointed the three plaintiffs to be directors. All the defendants, except Gay, were subscribers to the memorandum; Maclean and Mew were clerks in the office of the solicitors of the company, Adams was the secretary, and Bingham and Langridge were clerks in his office. The only suggestion made in the affidavits filed on the part of the defendants as to why the plaintiffs were not properly appointed was that the appointment was made before the actual registration of the memorandum and articles. The plaintiffs had allotted shares and notices had been sent out, but since the defendants had taken upon themselves to act as directors the allotments had been cancelled.

Mr. Justice Kay: Until the memorandum was registered there was no incorporation. There can be no directors before the company exists.

Mr. Renshaw said that after the incorporation the election of directors was confirmed.

Mr. Justice Kay said that until the company was incorporated the subscribers to the memorandum were merely promoters, and could not appoint directors.

Mr. Renshaw pointed out that Table A provided that the names of the first directors should be determined by the subscribers to the memorandum.

Mr. Justice Kay repeated that until they became a corporation they had no power to appoint directors. If the names of the directors were put in the articles, it was just as though every subscriber had put his hand and seal to the deed appointing those persons directors.

Mr. Renshaw observed that here every subscriber had concurred in appointing the directors. According to the minutes, it appeared that after the incorporation of the company the

subscribers to the memorandum met and appointed the plaintiffs as directors, and this was a good appointment.

Mr. Justice Kay suggested that a meeting of the company should be held and directors appointed.

Mr. Renshaw said there was a difficulty about this, as it was not known to what extent particular individuals were or were not shareholders, as the defendants had cancelled the allotments. On June 5, at a meeting of the subscribers, additional directors were appointed, and the election of those before nominated was confirmed.

Mr. Martin, Q.C. (with him Mr. Farwell), for the defendants, contended that the plaintiffs had not been validly appointed, as the notice did not state the object of the meeting; next, that a majority of the subscribers was not present, and proper notice of the meeting was not given. He was quite ready to call another meeting of the subscribers if what had been already done was not sufficient.

Mr. Justice Kay said he had seldom seen such a series of blunders committed in connection with any joint-stock company. The notice of motion asked that the defendants might be restrained from holding any meeting having for its object the removal of the plaintiffs (other than the company) from the directorate, and from in any way interfering with the plaintiffs in their position as directors, and from appointing any other directors until the trial of the action. It was the first time he had ever heard such an application brought before the court. It was said that the plaintiffs were appointed directors by the subscriber to the memorandum before the company was registered; but this could not be so, as table A had no relation to a joint-stock company until it was registered. The plaintiffs were never appointed directors alone by any proceeding after the company was registered. According to the first minute, the plaintiffs and a Mr. Curzon were appointed directors, but the date of this appointment was uncertain, as there appeared to have been an alteration made in the book, though no one could say by whom it was made. On June 4, a notice was issued by the secretary to the effect that in consequence of the irregularity in appointing directors, a meeting for that purpose would be held on the following day, and from the minutes it appeared that six of the subscribers attended, when it was proposed that the plaintiffs should be appointed. To this an amendment was made, adding two other names, and the amendment was carried. The plaintiffs in their affidavit stated that the subscribers met on June 5, and "effected to appoint additional directors, although we have refused to recognise any such appointment." So that the plaintiffs maintained that the only valid appointment of directors was before the company was registered. It was not necessary to go further, but he might observe that on April 23 the plaintiffs purported to allot shares, though, upon looking at the minutes, he found they had not been signed, as they ought to have been. Then, on July 5, the first meeting of shareholders was called; but to this no one but the subscribers were summoned. The proposition on which the motion was based—viz., that the plaintiffs were the only directors of the company—depended upon their having been appointed before the company was registered, and he was of opinion that this was an invalid appointment. Therefore, the people who were really the directors were all the subscribers to the memorandum. Whether anything had been done since binding upon any human being he did not now decide. The motion would be refused with costs.

Sinking Appliances at Llanbradach.

An Interesting Paper Descriptive of a Plant in which the Author has Applied Successfully a Number of Original and Useful Ideas.

BY W. GALLOWAY.

(From Proceedings of the South Wales Institute of Engineers.)

(Continued from July issue.)

The water from the bottom of the shaft has hitherto been raised by means of an arrangement imagined and carried out by the author in January last. He had long regarded the laborious and expensive method of bailing the water by hand into a barrel with open top (occupying the whole attention of three, four, or more men, when the quantity to be removed amounted to between 2,000 and 3,000 gallons an hour, and limited in its application to that amount) as a reproach to the art of mining. Having considered various methods of effecting the same object by mechanical means, he at length decided to fill the water-barrel by means of a vacuum, making it air-tight at the top, and providing it with a valve opening inwards at the bottom.

Fig. 10. Pneumatic Water-Barrel. Scale, $\frac{3}{4}$ in. = 1 ft.

Figs. 8, 9, 10, 11 and 12 represent this arrangement, and its principal details, as applied at Llanbradach. The *pneumatic water-barrel* consists of a cylindrical vessel of sheet-iron, 4 feet 2 inches in diameter, and 8 feet high, closed at the top, in which there is a door, *a*, bolted to the cover, and serving as a means of access to the interior when removed. The bottom, *c, d*, is 5 inches above the bottom of the cylinder. It consists of a steel plate $\frac{5}{8}$ inches, with a central opening 18 inches in diameter. The valve-seat was turned in a lathe, so as to secure perfect trueness. The valve, *b*, consists of a block of cast-iron, *e* (Fig. 12), having its lower face and vertical sides turned quite true. Over this turned face a sheet of leather is tightly *cupped*, and held in place by a tightly fitting wrought-iron hoop, *f* (Fig. 12). The hoop is secured by three tapping bolts, *g* (Fig. 11). A circular plate of iron, 16 inches in diameter, is bolted to the bottom of the valve, as shown, by means of six bolts with counter sunk heads. A spindle *h* (Fig. 9), working through two guides, and having a turned ball at its lower end, is held loosely in a socket in the valve, as shown in Figs. 9 and 12. In this manner the vertical movement of the valve is secured, while the ball and socket joint enable it to accommodate itself to the seat in any position into which it may be turned. At *k* (Figs. 8 and 9), one-half of an instantaneous coupling, identical with those used by the

Fig. 11. Pneumatic Water-Barrel. Scale, 1 in. = 1 ft.

Vacuum Brake Co., and supplied by the same makers, constitutes the outside termination of the pipe *l*, which, passing through the side of the cylinder, rises to within an inch of the top

Fig. 12. Pneumatic Water-Barrel. Scale, 1 in. = 1 ft.

in its interior. A glass gauge at *m* shows the height of the water in the interior when it rises to that elevation. The instantaneous coupling and the water-gauge are both protected by a strong angle-iron rib, *n* (Figs. 8 and 9), which projects from the side of the cylinder, as shown, and serves to guard them from the blow given by any large body such as a bucket. Care must be taken not to allow the point of a leg of a

Fig. 13. Automatic Water-Tank. One side partly removed. Scale, $\frac{1}{4}$ in. = 1 ft.

drilling-machine, which is being let down by the winding rope, to enter between the angle-irons. The author has known of one gauge-glass being broken in this manner, and giving rise to a loss of time amounting to half an hour, while it was being replaced, but he does not know of any other instance of such an accident. This one could have been quite easily avoided by the exercise of the slightest degree of foresight on the part of the man in charge of the shift.

The vacuum is created by means of an ordinary air-pump condenser constantly working at the surface. The steam-cylinder of this air-pump is 10 inches in diameter by 20 inches stroke, and steam is cut off at one-fifth of the stroke by means of adjustable hand-gear. The

vacuum pump is 14 inches in diameter by 20 inches stroke, coupled tandem-fashion to the piston-rod of the steam cylinder. This engine produces a vacuum equivalent to a column of mercury from 20 to 22 inches high, both in a receiver near the top of the shaft, consisting of an old egg-end boiler 24 feet 8 inches long by 5 feet in diameter, and in a system of pipes of 3 inches in diameter, communicating with it, one of which descends to the bottom of the shaft. It is there connected with a flexible hose 30 feet long by 2½ inches in diameter, provided with a stop-cock, and terminated in one-half of an instantaneous coupling corresponding to the other half, which is affixed to the pipe *l* of the water-cylinder, in the manner already described.

When it is desired to fill the pneumatic water-barrel, it is lowered to the bottom of the shaft, and rests with its hollow end under water. One man then attaches the instantaneous coupling of the flexible hose at *k*, opens the stop-cock, and observes with a light at *m*, when the water rises in the gauge-glass. As soon as he notices the water rising to the desired height, he shuts the stop-cock, detaches the instantaneous coupling, and apprises the man in charge of the signal that all is in readiness. The latter then signals to the winding engine-man, who thereupon raises the water-barrel with its contents to the surface. On its arrival there the banks-

man shuts the doors, draws a water-trolley under it, and signals to the engine-man to lower it. When this is done, the barrel descends; its valve is arrested on the top of a conical block of wood; and, as it descends further, the water pours out into the water-trolley, and flows thence into a wooden trough, which conveys it into a drain provided for the purpose. In this manner the water-barrel is filled in 30 seconds and emptied in 30 seconds, while the remaining manoeuvres occupy about 1½ to 2 minutes. It has been possible, with this arrangement, to sink in the Pennant sandstone, with 5,000 gallons an hour in the

bottom of the shaft, at the rate of 5 and 5½ yards a week; the highest rate of progress in the same ground with only 500 gallons an hour, having been 6½ yards a week. At one time, when the quantity of water in the bottom rose to 7,000 or 7,500 gallons an hour, the rate of progress attained was rather under 4 yards a week, the rock being at the same time exceed-

Fig. 14. Scale, $\frac{1}{4}$ in. = 1 ft.

ingly hard and compact. Although these quantities of water are, comparatively speaking, insignificant when pumps can be applied to elevate them, they are sufficient to render sinking impossible by the system of bailing. The establishment of pumps in this shaft was a question that could not very well be solved at the commencement of the operations, as it was impossible to determine what quantities of water were likely to be met with; and even as the sinking progressed from day to day, the uncertainty continued the same, so long as the bottom of the Pennant sandstone had not been reached, and the Shale series entered upon. All the Collieries surrounding Llanbradach except Albion—namely, Harris's Navigation, Newport Abercarn, Abercarn, Risca, and Caerphilly Collieries—are provided with heavy pumping machinery and powerful engines, all of the Cornish type except the one at Caerphilly Colliery, which is one of Barclay's patent engines. At Albion Colliery, on the other hand, there are two or more direct-acting steam-pumps established in lodgments made in the side of the shaft.

The shaft at Llanbradach is situate about equidistant from Albion, Caerphilly, Risca, and the two Abercarn Collieries. Under these circumstances, the author did not feel justified in advising the owners to establish either light or heavy pumping machinery. If he had advised heavy pumping machinery at the commencement, the cost would have been very great; and if he had advised light pumping machinery, there was a possibility that his advice might have been stultified by the result, and that the light machinery would require to have been removed, and to have been replaced by more expensive appliances. The specification under which the shaft is being sunk defines 4,000 gallons an hour in the bottom, as the maximum quantity with which the contractor has to deal; and that when the quantity exceeds this amount, whether pumps have been provided or not, he is to receive certain allowances, which are left to the discretion of the engineer. The allowances for extra water to a depth of 193 yards have amounted to £498, or an average of about £2 12s. per yard over the contract price. But the aggregate quantity of water met with down to a depth of 135 yards from the surface amounted to 9,000 gallons an hour—namely, 5,500 gallons above 95 yards, and 3,500 gallons between 95 and 135 yards. Of these two quantities, 5,000 gallons an hour were walled out by means of brick and cement walling, leaving only 500 gallons an hour in the bottom at 95 yards. Below 95 yards the water gradually increased up to 3,500 gallons an hour at 135 yards. At the last-named point a piece of an old boiler, 5 feet in diameter and 10 feet 6 inches long, with one end open and the other closed, was fixed on a beam, with its centre directly below the rope of the small winding-engine, and that engine was employed in raising the whole of the water running into the shaft, except some 500 gallons an hour which escaped from the sides between the bottom and the collecting curb.

As the shaft was deepened still further, the quantity of water issuing from the rock below the collecting curb gradually increased, until at length it amounted to 5,000 gallons an hour between 135 and 190 yards. But in the meantime the springs between 135 and 95 yards had decreased to about 1,800 gallons an hour. The cistern was then lengthened to 14 feet 6 inches, and fixed at a depth of 190 yards, a collecting curb having been put in, as in the former case, and the 1,800 gallons an hour collected at the

higher curb was also run down into it in 3-inch pipes. Another stronger engine was then put to work to raise the water from this cistern, and easily raises 5,000 gallons an hour by means of the following apparatus, of which the principal details are represented in Figs. 13 and 14:—*a* is the winding-rope of the auxiliary winding-engine, and *ee* (Figs. 13 and 14) the guide-ropes; the two latter ropes are fixed in the bottom of the cistern at 190 yards, pass over two pulleys, *f* (Fig. 1), above the winding-pulley, and are wound upon two small hand-crabs standing on the surface at some distance from the shaft, on which there is sufficient rope to reach to a depth of 500 yards if required. The tank, *b*, is 2 feet square inside; has parallel sides for 8 feet of its length; terminates upwards in a pyramidal frustum-shaped top, which is bolted to its square part and can be removed when desired; and has a bottom sloping from front and back towards the centre, as shown. Four projecting studs, *cc*, one on each side, at top and bottom, clasp the guide-ropes loosely. The tank is guided by these ropes in ascending and descending the shaft, but when it reaches the top the studs on each side pass between fixed guides, *dd*, each consisting of two bars of angle iron riveted to a long plate of sheet-iron and made fast to the woodwork.

A valve, *k*, in the bottom serves both as a means of filling and as an outlet for the water which escapes into a sloping adjutage, *f*, and precipitates itself thence into a wooden trough, *m*, whence it runs into the drain mentioned in connection with the *pneumatic water-barrel*. The valve *k* is raised by means of the lever *o*, which comes in contact with a movable wooden bar, *p*, working between two iron guiding-bars, not shown in the drawing. A weight, *u*, suspended from the bar *p* by means of a chain, *s*, can be regulated so as to open the valve. The bar *p* turns upon an iron bolt at *g*, which serves as a hinge to the system. The upper ends of the fixed iron guides are attached to two wooden beams, *t*, one vertically above each side of the opening through which the tank reaches the surface, and their lower ends are secured at *v* in a similar manner to the sides of the opening just named. The suspending bow, *w*, of the tank passes down each side and under the bottom, as shown, the latter part being curved in the form of a semicircle, and serving as a protection to the bottom of the tank when it is lowered to the bottom of the collecting cistern, where it comes to rest on a sheet of india-rubber $\frac{1}{4}$ inch thick. The filling and emptying of the tank are purely automatic, and only one man is required to attend the engine. This tank can be easily filled and emptied twenty-four times an hour from a depth of 190 yards; and as its capacity is about 212 gallons, it brings, as previously stated, about 5,000 gallons of water to the surface during every hour it is at work.

The author may state, in concluding, that he has had the intention from the first, provided circumstances were favorable, to recommend the owners to apply a direct-acting steam-pump to raise the water met with in sinking so soon as a point was reached at which most of it could be collected. He has now advised them to put in a compound Worthington pump capable of dealing with 10,000 to 12,000 gallons an hour, at the nearest point below 200 yards at which a lodgment can be conveniently formed, and preparations are being made to carry out his suggestions. He hopes also that at an early date he may have the honor of presenting some further details of the same subject to the members of the Institute.

In General.

Following up our comment upon the commercial future of our immense area of phosphate lands and the existing demands for such from outside sources, the *Trade Review*, in a recent issue, makes the following pointed and well-timed reference:—"The speculator has, it must be admitted, too hard a grip upon our phosphate land, while the 'promoters' upon the other side of the Atlantic only care for the money they can make by floating a company, since it matters not to them whether the enterprise is a paying one or is a miserable failure. If we once get a bad name in this respect, then woe be to us! Moreover, over-capitalization is a stumbling block which is ever in the way of joint stock enterprises. It takes no argument to show that the smaller the amount of capital embarked, consistent with effective and enterprising work, the more certain the chances are of paying a respectable and satisfactory dividend, while the better pleased will the stockholders be, and the better disposed to take an interest in other Canadian undertakings. If we are careful with respect to the properties we place upon the market and the amount at which we capitalize them, there can be no question as to the long life and prosperity of the already important Canadian phosphate interest."

Two very important phosphate suits have just been terminated in South Carolina after going through the highest courts for ten years. The State discovered in 1887 that certain parties were working phosphate properties belonging to the commonwealth, but which were claimed by those in possession and who declined to negotiate for a release of the same. Their aggressive attitude was continued throughout the progress of the cases in court, and a large array of legal talent was employed on both sides to fight the issue. The contest was one of the most exciting and interesting ever known in the State, and the outcome has an important bearing on other phosphate interests, as the successful litigation will no doubt encourage similar attempts to seize disputed mining property in the State from which no royalty is received on leases. The State won both cases, and the net result may be summed up as follows:—

First, the acquirement by the State of the title to the Morgan Island marshes, embracing over 5,000 acres of phosphate marsh lands. Second, the establishment of the title of the State to the Chisolm's Island creeks, containing also a valuable phosphate deposit. Third, the payment into the State treasury, as a net balance after defraying the expenses of all these cases, of nearly \$32,000, being a reduction of \$44,000 from the original verdict of the court, on account of the assignment of the company against whom the judgment was obtained for damages.

This has put a quietus on phosphate land speculation which started out with great enthusiasm about three months ago, as prospective buyers are satisfied to wait until the State has finished the investigation of other claims. The result of the suit is, of course, gratifying to mining companies who are working property leased from the State, as it removes formidable competition and may maintain market values for phosphate rock.

The attention of our readers is directed to the following extract from a letter received from Messrs. Danbmann Bros. & Co., Chemical and Super-Phosphate Manufacturers, Baltimore:—

"As holders of the Canadian Patent No. 31,114, we are in possession of an improved process for converting to soluble form the Phosphoric acid of Phosphatic rocks, which has special advantages applied to Apatite, and being desirous of entering into communication and forming a connection with such parties in Canada as would find an interest in this process, we are led to lay the matter before you, hoping for your good assistance toward that end.

We ask your attention to the following fact: Our process enables us (as experimentally proved) to produce from Canadian apatite a Phosphate containing about 40 per cent. "available" Phosphoric acid, of which nearly all is "soluble." In view of the controlling importance of freight charges in the distribution of Fertilizer material, it is easy to see the value of a process that minimizes these changes, by giving a concentrated product apart from the increased intrinsic value of that product for manurial purposes. Manufactured near the mines such a phosphate ought to reach the consumer with less than one half the usual freight on ordinary goods for a shipment of equal value.

Again our process obviates one great objection to the use of Canadian apatite, which has stood much in its way with manufacturers in the United States, viz: the disengagement of Hydro-fluoric acid and Chlorine by the ordinary treatment with Sulphuric acid. In manufacture by our process the fluorides and chlorides are not perceptibly attacked and remain inert. The two points to which we have asked your attention, are the main advantages of our new process, which, as you will at once perceive are of especial value to Canadian Manufacturers and Miners.

Ocean Shipments.

The following are the ocean shipments from Montreal to Europe, to date:—

Date.	Vessel.	Destination.	Shipper.	Tons.

English Fertilizer Market.

We are indebted to Messrs. Couper, Millar & Co., London, for the following report of the English fertilizer market, dated 16th instant:—

We have to report a continuance of the firmness of prices of all raw materials and a somewhat larger volume of business than is usual at this time of year.

Mineral phosphates.—Although shipments of Canadian have been coming forward with fair regularity, there still remains a large quantity

to be shipped, and the rise in price is counterbalanced by the increased rates of freight; 80 per cent. is quoted at 12½d. to 12¾d., according to port, and 70 per cent. finds a ready market at 10½d., both with ½th rise. South Carolina is quoted 10½d., but even at this figure, the raisers do better by selling it to U.S.A., where the increase in the consumption of super-phosphates is still going on. Very few fresh sales are reported in the high grades of Somme phosphate, and prices show signs of rising still further when the autumn season sets in. There is a good demand for 50, 55 and 60 per cent qualities. Belgian 40 to 45, and 45 to 50 per cent. we can offer at the usual prices, both for this year and next.

Templeton District.

We are glad to see that all the talk about a line of railway into the Templeton district is at last beginning to assume some definite form, for the last issue of the *Official Gazette* contains a notice of application for incorporation by the Templeton Phosphate Railway Company. The proposed line is to have its starting point from the Ottawa River, near East Templeton, and will run as far as the Gore of the Township, or a distance of some sixteen miles. It is also proposed to build another line starting at the 8th or 10th Range of Templeton, near Perkins' mills, running in a westerly direction about 15 miles. The offices are to be in Montreal. The capital stock is placed at \$50,000. The names of the applicants, all of whom are to be first directors of the road, are the Honorable Alexander W. Ogilvie, senator; Raymond Prefontaine, M.P., advocate; Azro B. Chaffee, gentleman; George G. Foster, advocate and Arthur Gagnon, gentleman, all of the city of Montreal; Hugh McMillan, M.P., Rigaud; Louis N. Champagne, advocate, Hull; Alphonse Lemieux, Quebec; and Robert Hargrave Martin, New York. There can be little doubt that the construction of such a railway as this is highly desirable, and that numerous benefits to the phosphate interests would ultimately result from it. Whether the promoters really mean business is a question which time only will tell.

Mr. Robert Blackburn is equipping his mine with heavier machinery than that formerly in use. Work goes along briskly, as usual, and a good output of phosphate is being produced.

Lievre River.

Mr. O. M. Harris, Montreal, representing the Canadian Phosphate Company (Limited), under date of 24th of August, writes:—"You will be pleased to learn that both our Crown Hill and Star Hill mines are at present looking very favorable, and last week's output averaged about 195 tons, which is very satisfactory. Pits Nos. 2, 3 and 9 at Star Hill, and 6 and 8 at Crown Hill, are looking splendid for future working, there being a large quantity of rich phosphate in sight there. Our improvements at Crown Hill are almost all completed, and when they are, both our Crown Hill and Star Hill will undoubtedly equal the best equipped mines in this country. We have everything ready to handle a large output, with the exception of a tram-road from our Star Hill mines to Landing, but hope the time will soon come when the output from this mine will permit of our going to this expense."

We regret to have to record a couple of accidents—one of them unfortunately resulting fatally—at these mines. While a car loaded with rock was being hauled up the tramway, on 17th inst., a lad named Gleeson, employed as a

driver, fell in front of the wheels, which passed over him and caused instantaneous death. No blame is attributable to anyone, as the accident was entirely due to the lad's thoughtlessness. In the other casualty, Mr. Tom Lyons, mine foreman, sustained a severe shaking up and several bruises by a fall of some 25 feet while in No. 5 pit. We are pleased to learn that Lyons will soon be about again.

The output of phosphate from the High Rock pits is again up to the old standard. The vein, which had pinched out somewhat in No. 11, has come to the fore again, and is yielding as abundantly as ever. The management have been, however, again unfortunate enough to lose another loaded scow, which upset a few days ago in the Rapids.

Kingston District.

"It has been observed that the 'note' of quickened interest in phosphate mining near Kingston does not take the direction of intelligent efforts for the improvement of roads and the erection of a grinding mill. Men who are bent on mere speculation obtain the "chance" or "option" of buying property in order to sell out. If they can find a buyer the owner of the land gets his money, and if not the farmer is left with a registered document affecting the title to his land and a job for a conveyancer when the boom is over. No permanent good to the country is likely to come from this kind of speculation. No wonder that money and men seek other countries, where intelligence and activity go hand in hand to reduce the friction of tedious transportation and expedite business."

Edison Prospecting for Iron Ore.

A report from Reading, Pa., states that Thos. A. Edison, Samuel Insull and Mr. Kennally, of the London Electric Light Company, after eight days hard work, completed on the 17th inst. the survey of vast magnetic iron ore leases in this country and returned home, after seeing their new plant for separating ore by electricity in operation. During the survey their work frequently extended until 2 o'clock in the morning. Each carried a cylindrical brass box fitted with a magnetic needle. The dipping of the needle indicated the depth of the ore and thickness of the vein. The new magnetic ore separator is located on Gilbert's Hill, on a ten-acre tract near Bechtelsville. Iron stone is found here in large quantities. The stone and ore that hitherto was handled at heavy cost is now utilized at greatly reduced figures. The plant just erected to experiment with, cost \$35,000. It is 120 feet long, 31 feet wide, and is divided into three sections. Immense engines, ore crushers and dynamos do the work. The iron ore is crushed into fine sand. It is then carried along on belts and up into the third story, where it drops into a hopper. The crushed ore is then shaken out and dropped some eight feet, where it comes in contact with a powerful magnet, which draws all the iron ore to one side, swerving its falling course into a trough leading to a large bin, while the particles of matter containing no ore descend perpendicular and drop into a refuse bin. The magnet draws the crushed particles of iron completely out of the sand and dirt as it falls from its height, and it is very interesting to watch the stream of iron being swerved from its course by the magnet. The refuse sand is run past the magnet a second time to secure all the iron that remains in it. Where the "separator" is located, the dust is so fine and profuse that every person who goes into that portion of the building, which is 20 by 30 feet

and three stories in height, wears a patent rubber mask over his mouth and nose and breathes through a wet sponge. Rock ore is being taken out which yields fifty per cent. of ore. This invention can only be applied to magnetic ore. At the present time 150 tons of rock are on an average mined and separated per day of fifteen hours. One ton of prepared ore ready for the furnace is obtained from seven to nine tons of rock. It is said that ore prepared by this separator requires about one-third less fuel than the ordinary ore to smelt. No. 1 pig metal is the result of the smelting of this magnetic separated ore. The refuse sand is said to be worth about \$1 a ton, and the intention is to use it in the manufacture of an artificial stone for monuments, paving blocks, etc.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

MINING NOTES.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

At the Annual Meeting of the Gold Miners' Association of Nova Scotia, held at Halifax, on 6th March, a resolution was passed adopting the "Canadian Mining Review" as the official organ of this Association. Our readers may therefore rely upon the accuracy of all information published in these columns bearing on the gold mining industry of the Province.

Nova Scotia.

Pictou and other Districts.

At the Albion, the bottom of the Foord shaft has been reached, and on the exploration of the mine, everything looked favourable.

The Drummond colliery—owned by the Inter-colonial Coal Company—is being worked night and day, and shipments steadily maintained.

We regret that, by some unforeseen circumstance, our usual interesting budget of items from the gold mines should not have reached us in time for publication in this issue.

The Acadia colliery has been idle for three weeks, owing to a break down of the hoisting engine, but so soon as the necessary repairs are completed, a night shift will be started in addition to the day shift. The engines will for a time be run at a reduced speed, until the bearings be worn down to place. This is done for the purpose of getting out and maintaining the usual output.

Nova Scotia Gold Yield for Half Year Ended 30th June.

We are indebted to the extreme courtesy of that admirable institution at Halifax, the Department of Works and Mines, for the following full and complete statement of the gold yield for half year ended 30th June last, from the various districts at present in active operation throughout the Province:—

At the Black Diamond colliery work is progressing slowly.

We notice that incorporation has been sought for by the "East River Gold Mining Company, Limited." The capital is placed at \$2,700 in \$100 shares. The names of the applicants are: William A. Malling, 110 Barrington street, Halifax; Charles W. Outhit, 112 Barrington street, Halifax; Jacob Withrow, 104 Barrington street, Halifax; Silas Hubley, 12 Bedford Row, Halifax; A. C. Layton, 37 Argyle street, Halifax; John F. Outhit, 112 Barrington street, Halifax; W. H. Teas, 151 Hollis street, Halifax; Thomas Hanson, Windsor; Cyrus Hubley, 11 John street, Halifax; Geo. L. Flawn, Granville street, Halifax; Thomas A. Hubley, 35 John street Halifax; Benjamin J. Hubley, 35 John street, Halifax; Edwin Hubley, 12 Bedford Row, Halifax; George B. Maling, 191 Brunswick street Halifax, and George Maling, Windsor street, Halifax.

The contracts for the supply of coal for the Intercolonial railway for the year ending 30th June, 1890, are reported to have been as follows: Cumberland Railway and Coal Co., Spring Hill, 92,000 tons; Phoenix Coal Co., Maccan, 23,000 tons; Cumberland Coal Mining Co., Maccan, 10,000 tons; Acadia Coal Co., from Yale and Albion Collieries, 30,000 tons; Intercolonial Coal Mining Co., Westville, 20,000 tons; Black Diamond Coal Co., Westville, 10,000 tons. The prices are said to range from \$1.90 to \$2.20 per ton.

The New Glasgow Coal and Iron Company has sunk a prospecting shaft on their property at Springville, and at a depth of 45 feet drifting is being carried on. Mr. Chambers and a small force had just commenced operations at the time of our visit, but the indications of a good body of rich brown Hematite ore were very apparent.

New Brunswick.

Application for Letters Patent for incorporation is made by the Northern New Brunswick Mining Company, with a capital of \$200,000, in \$1 shares. The offices of the company are to be at Woodstock. The names of the shareholders are as follows, of whom the three first named are to be the first or Provincial Directors of the company under the proposed incorporation: John A. Shea, Grafton; Solomon Perley, Upper Woodstock; John Graham, Woodstock; Albert Brewer, Upper Woodstock; Frederick H. Hale, Grafton; Samuel T. Baker, Woodstock; G. Randolph Ketchum, Upper Woodstock.

Quebec.

The Montreal *Gazette* publishes a statement announcing that the Coleraine Mining company, composed of Hon. J. A. Chapleau, A. N. Montpetit, C. A. Dansereau, A. Desjardins, M.P., and others, have taken an action for \$20,000 against the Megantic Mining company. This procedure is to compel the defendants to sign a bill of sale of these mines to pay the purchase price, \$17,000, besides damages to the amount of \$3,000.

The directors of the Bell's Asbestos Co., Limited, have declared an interim dividend of 12s. 6d. per share, free of income-tax, for the half-year ending June 30th last, being at the rate of 25 per cent., per annum.

Cable announcements state that the Anglo-Canadian Asbestos company, has been registered in London, with a capital of £20,000, to carry out an agreement between the Anglo-Canadian Asbestos Co., in liquidation, and W. H. Irwin to acquire and work asbestos prop-

erties in Canada. Mr. Irwin is the London representative of the firm of Irwin & Hopper, Montreal.

We are advised that Messrs. King Bros., extensively engaged in asbestos mining in the Thetford district, have opened offices at Liverpool, under the management of Mr. C. Stuart King, for facilitating the transaction of their large mineral, timber and general business with the United Kingdom and the Continent. Mr. King, who is a nephew of the Kings, of Thetford, has been associated for eight years with Messrs. Duncan Ewing & Co., wood brokers, of Liverpool.

Mr. Thomas Mackintosh and several other Eastern Townships' gentlemen are opening up a most promising deposit of copper on Lot 22, 1st Range North of Garthby, about four miles from Garthby Station, on the line of the Quebec Central Railway. Your correspondent is informed that Mr. C. C. Colby, M.P. for Stanstead, is one of the interested parties.

Great activity is prevalent at the various asbestos mines. The demand continues strong, and satisfactory outputs are maintained. An offer of \$100 per ton for No. 1 quality was recently refused, the market price for this quality having increased to \$115 per ton, and even higher prices are obtained. Whilst the area from which this precious mineral is got is very limited, the demand continues to rapidly increase, so much so that orders cannot be executed. The Italian asbestos cannot compare with the Canadian product in quality of fibre, and as a consequence buyers are looking to this country entirely for their supplies. We are told that there is a great and growing demand for the mineral all over the continent—even in Russia.

Ontario.

The Sudbury District.

One of our Sudbury correspondents writes us that everything about the place has a quiet business-like air. There is no excitement such as formerly. Very little exploration is going on in the surrounding country, but new finds are occasionally reported. The Copper-cliff mine is now down between 450 and 500 feet. The Evans is working steadily in a good body of ore. This mine is the richest in nickel. The open workings at the Stobie were resumed as soon as the weather became mild enough in spring, and have been pushed on ever since. The total output is in excess of the smelting capacity of one furnace. The second smelter, with buildings, &c., is well advanced, and the machinery connected with it is being placed in position. The first smelter has run without a hitch and without perceptible deterioration since it started last December. Its average consumption of ore has exceeded 100 tons a day. The matte produced contains 40 per cent. and upwards of metal, 15 per cent. nickel, and 25 of iron. It is allowed to cool in the pots, and is turned out in hemispherical masses of 500 pounds each. These are broken up and barrelled for export. The roasting of the ore, under the skilful management of Dr. Fets, has been very successful and economical. The smelting has also been a marvel of cheapness, not exceeding \$2 a ton, including cost of coke. The cost at most furnaces is over \$5 a ton.

A despatch from Sudbury, under date of 16th inst., advises:—"A special train arrived here on the 13th inst., containing the following gentlemen, who are connected with

the Dominion Mining Company, of Sudbury, and whose mineral property is very extensive, both north and south of this town. There were in the party Mr. Duncan McIntyre, Mr. H. McDougall, Mr. Duncan McIntyre, Jr., Mr. John McIntyre, president, Montreal; Prof. Ferguson, Prof. Simpson, Glasgow, Scotland; Dr. Graham, Edinburgh, Scotland; Mr. George Attwood, M.E., London, Eng.; Mr. John Ferguson, North Bay, Ont. Mr. Attwood is consulting engineer in the business, and Mr. John Ferguson, of North Bay, a large property owner there, and a nephew of Mr. Duncan McIntyre, is at present residing in Sudbury, where he superintends the company's office and mining business. The whole party, on their arrival, went north to the mine now being worked in Blezard, and spent some time inspecting the property. They were highly satisfied with the results so far attained, and evidently found things looking better than they expected. The party are to have a meeting here, but will first proceed to their mines on the Algoma branch. A large building for offices, etc., is being erected."

We are favored with some excellent samples of nickeliferous chalcopyrite and argentiferous galena from the Straight Lake locations owned by Mr. Isaac Moore and other Ottawa people. A most favorable report has been made on the extent and richness of these properties by Mr. C. C. Boyd, M.E., who has also made analysis of the ores as follows:—

NICKELIFEROUS CHALCOPYRITE.

Nickel....	\$25 60	per ton, 2,000 lbs.
Gold.....	28 00	" "
Silver.....	0 45	" "
Total...	\$54 05	" "

ARGENTIFEROUS GALENA.

Gold.....	\$14 00	per ton, 2,000 lbs.
Silver.....	17 00	" "

"These samples," Mr. Boyd says, "were selected from the shaft at a few feet below the surface, and without a doubt will increase in quality, as it is fully demonstrated by the vast width of the lode that there exists inexhaustible quantities."

Simpson Bros. are down 35 to 40 feet in two shafts. At last cleaning up they got 8 pounds of platinum and considerable gold and silver. A short time ago a piece of quartz was taken out 25 pounds in weight and thickly speckled with free gold.

The Murray mine, 4 miles northwest of Sudbury, is being tested by Vivian & Co., Swansea, Wales, and their assayer is said to be well satisfied with the results.

Port Arthur District.

At Crown Point prospects are good. The Pioneer is producing rich native, and solid black silver, from the Adit. The ore is now barrelled for shipment to Nebraska. The Cumings and Montgomery mines are in good shape.

The Dawson property, eastward of Crown Point, is doing well. This property embraces R 83 and R 64. Several strong veins traverse through it, including Crown Point.

The Beaver mine, which is down 530 feet, still continues to put out a uniform quantity and quality of ore.

The Black Fox property, on location 146 T is now being worked; prospects good.

The Elgin mine is 14 feet deep, with drifts E and W, each about 140 feet long. The ore resembles the Beaver mine, and gives satisfaction in uniformity of value.

At the Lone Pine mine, miners are engaged opening up this new lode. It is situated on the Government road from Murillo to the Beaver, and about three miles from the latter place. This lode is in the Animikie series of the Cambrian formation, and gives good promise upon further development.

The Badger mine and mill are working vigorously night and day. Another shipment of this rich ore is being made, consigned to Denver, Colorado.

The Silver Star Mine operated by Mr. E. Watts, Buckingham. Drift in 90 feet—vein strong, carrying leaf and black silver.

The Mink Mountain Mine is being developed under the superintendence of Mr. Hulbert, of Duhth. The prospects are most encouraging, and when machinery is in place and the mine opened there is every reason to believe it will prove of much value.

The Silver Gleece Mine is identical with Mink Mountain, and developing very encouragingly.

On the Queen Mine drifting is being actively pushed on in a strong defined lode.

The Silver Wolverine Mine has its plant of hoisting and pumping machinery now in place. Work will be at once resumed in sinking No. 1 shaft (which is now 100 feet deep) and also No. 2 shaft which is down 33 feet. The prospects are good as rich silver has already been found on the location.

The West End Mine shows a strong and well defined fissure vein for 1,500 feet on surface, which has been somewhat developed with encouraging results.

The Shuniah Weachu or East End Silver Mountain, is busy hoisting good "pay rock" from No. 3 shaft. From No. 4 shaft ore of great value is being brought to surface. The ore is consigned to England for treatment.

North-West Territories.

The Canada Northwest Coal and Lumber Syndicate has been registered with a capital of £70,000, in order to purchase the Coal Creek and Bow River mines and other property near Calgary, and work the same. Lord Norbury, Viscount Grimston, M.P., and Sir George Baden-Powell, M.P., are among the first subscribers.

The following interesting particulars of a new and evidently rich find of oil in the North-West are from a private letter to a gentleman in Ottawa:—For eleven weeks we have been prospecting among the mountains for coal oil deposits. I am happy to say we have been eminently successful. We have located a considerable quantity of oil land, some on the Eastern slope, and some on the British Columbia side. So soon as we felt perfectly certain as to the importance of our find, we had several samples assayed. The result gave 91 per cent. lubricating oil, 5 per cent. heavy oil, 1 per cent. water, and 3 per cent. foreign matter. This is the best oil ever discovered, and far ahead of

the Pennsylvania oil fields. There is plenty of head, the flow being about 4,500 feet above the sea level, and the crude oil can be run off in pipes any distance. It is the greatest find ever known. All the oil lands are within easy distance of the railway." The letter further states that arrangements are being made for developing the find, which, if correctly reported, adds immensely to the treasure to be expected from the North-West.

The Stair Coal Mining & Manufacturing Co. have about 12 men repairing their property, and in the autumn a sufficient number of miners will be employed to give a daily output of 150 tons. This mine was first opened in 1883 by the Saskatchewan Coal Mining and Transportation Company, and is located on the north side of the South Saskatchewan river, about nine miles above Medicine Hat. The property is connected with Stair Station, on the C. P. Railway by a spur track about two miles in length. After carrying on mining operations for two seasons, this company became insolvent, and the mine was closed down, to be opened again by the lessees—Messrs. Moore & Hunter, of Winnipeg—during the winter of '86-'87. Since then nothing has been done until the present season, when this property was secured by the first named company.

There is also another company making preparations to carry on coal mining near Medicine Hat, viz: The Medicine Hat Coal Mining and Railway Company, who have secured lands on the south side of the South Saskatchewan river, and about seven miles above the town. This company have about twenty men on the ground. They commenced sinking the shaft in the latter part of April, and have now reached the depth of about two hundred feet. The coal seam, it is expected, will be found about 270 feet below the surface of the prairie. The company afterwards propose connecting their property by the spur track with the C. P. R'y at Medicine Hat.

The Galt Company are busily engaged at Lethbridge in placing hoisting machinery and other plant in connection with their first shaft in position, after which a certain proportion of the output will be taken out thereby.

Various rumors are afloat concerning the Petroleum Springs discovered within the last two months in the Kootenay district. Report has it that samples have been analysed giving from 91 to 95 % of pure oil, and free from that strong odor so objectionable in Canadian oils. A surveyor is now in that section locating claims of which some seventy are reported as being staked out.

British Columbia.

The stamps and concentrator at the Barker-ville reduction works are now in full operation. The Jack Quartz Company have shipped to the works nearly twenty tons of concentrates, assaying from \$40 to \$50 per ton. It is the intention of the Government assayer to put these through as one lot, and if successfully amalgamated it will have a tendency to encourage quartz mining. The same company have already caught \$300 in free gold on the plates. The twenty tons of concentrates and the free gold were saved from seventy tons of ore.

We understand that Mr. Moore, Inspector of Mines for Scotland, has accompanied Mr.

McLeod Stewart and others interested in the Canadian Anthracite Coal Co. to Banff, with the object of reporting fully upon the present appearance and capacity of the mines to the English capitalists who propose to invest in the concern. Should the experts' report be favorable to the enterprise, it is stated that the stock of the new company will be increased to \$5,000,000, and that the mines will be worked to their fullest capacity.

The Laura Hydraulic Mining Company (limited) is seeking incorporation, with a capital of \$20,000, for the purposes of alluvial and quartz mining in the province. The trustees mentioned in the application are John Grant, Morris Moss and Alexander Gilmore McCandless, who are to manage the concern for the first three months. The chief place of business will be at Victoria.

Another new company will be the "Kootenay No. 1 Mining Company" (foreign), with a capital of \$600,000 in 120,000 shares of \$500 each. The place of business is Ainsworth, Kootenay district. The properties to be acquired and operated are located in Oregon, Washington, Idaho, and also in British Columbia.

The Cariboo Creek Mining Co. is also seeking incorporation with a capital of \$10,000 in \$10 shares. The trustees nominated are David Woolsey, Andrew J. Smith and Thos. Forrest. The chief place of business is stated to be at Donald.

General Mining.—Accounts to December 31 submitted in April, but an interim meeting is held in November. Dividend for 1884, 5 per cent; for 1885 and 1886, 3 1/4 each year; and for 1887, £4 13s. 9d. per cent. Reserve fund, £29,850.

Low Point.—The vendors' shares, up to the end of 1888, do not rank for dividend until 7 per cent. per annum dividends have been paid on ordinary. Accounts to Dec. 31. For 1887, 5 per cent. was paid on the ordinary shares other than those held by the General Mining Assoc., that Company foregoing their dividend rights.

North-Western Coal.—The deferred shares receive on dividend until 15 per cent. per annum (cumulative) has been paid on the ordinary. Accounts to June 30. Dividend for 1887-8, 5 per cent.

Sydney and Louisburg Coal.—Accounts to Dec. 31 submitted about May. Out of the profits of 1884, one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,574.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200. Reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £450,000; purchase consideration, £400,000, in cash or shares. Fully-paid shares issued to the vendor; partly paid to the public.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital of £100,000, of which £80,000 was the first issue. Most of the shares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1887. Accounts to October 31 submitted in March. No dividend yet. Debentures, £3,450. Reports are not obtainable, but this information is official.

Anglo-Canadian Phosphate.—The preference shares rank first for 7 per cent., and after a like rate has been paid on the deferred shares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £2,576, which was carried forward.

White's Asbestos.—Registered April 9th, 1883. the authorised capital is £100,000; first issue, £60,000, of which £20,000, fully paid, was issued to the vendor.

Jackson Rae Phosphate.—Registered May 9, 1889. **Western of Canada Oil.**—Accounts to March 31 submitted in May. Debenture interest is not paid. In 1886-7 there was a profit on working of £256; in 1887-8 of £690; and in 1888-9 of £1,279. Debit balance on March 31, 1889, £900. A loan of £8,400 has been obtained on the security of £30,000 B debentures.

England's New Boiler-Inspection Bill.

—A steam boilers bill has been introduced by Mr. Provand, Mr. O. V. Morgan, Mr. William Abraham (Mahon), and Mr. Howell, into the House of Commons. The bill provides for the compulsory periodical inspection, at the cost of, and on the responsibility of, the boiler user, of all boilers to which the Act applies; and also for registration in a Government Department of all such boilers, at a small fee, deemed sufficient to cover the expense of administering the Act. Any person working a boiler, for which he cannot produce a certificate from a duly qualified engineer, as defined in the Act, is subject to certain penalties, but the boiler user is at liberty to select any engineer he chooses, to furnish the certificate. The Act repeals the Boiler Explosion Act, 1882, but re-enacts the same modified in several particulars. The investigation of explosions of land boilers is to be dealt with by the Home Secretary's Department, as the inspector of mines, and also of factories, who are to assist in carrying out the provisions of the Act, are attached to the Home

Office. Both preliminary inquiries and formal investigations must be conducted in open court. No insurance company is allowed to grant a policy of insurance or a certificate for any boiler without proper inspection, and a policy becomes void on the expiration of cancellation of the certificate granted by such company.

Incrustation of Steam Boilers.—The incrustation of steam boilers has always been a matter of pressing importance to engineers, and many remedies have been proposed to remedy what is not only an inconvenience, but often a source of danger. The incrustation is due to the mineral matter, chiefly lime, which is contained in all hard waters and which is deposited on boiling, as we can see by looking at a tea-kettle that has been in use for only a short time. According to *Chambers' Journal*, a simple remedy has been tried by an Italian engineer, Colonel Potte, and, it is said, with complete success, in a boiler of twenty horse power, containing 126 tubes. He introduced into the boiler every week two keles (about four and one-quarter pounds) of sugar, with the result that, after four months' continuous working

only a very thin film of incrustation was formed, and this was easily removed by simple washing. Without the treatment with sugar, the same boiler had previously become incrustated in a period of six weeks. The method has the merit of simplicity and cheapness, and many will therefore be disposed to test its efficacy.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

NOTICE

Is hereby given that all communications in respect to matters affecting the Department of Indian Affairs should be addressed to the Honorable E. Dewdney as Superintendent General of Indian Affairs, and not as Minister of the Interior, or to the undersigned. All Officers of the Department should address their official letters to the undersigned.

L. VANKOUGHNET,

Deputy Superintendent-General
of Indian Affairs.

Department of Indian Affairs,
Ottawa, 11th May, 1889.

SEALED TENDERS addressed to the undersigned and addressed "Tender for Post Office, etc., Lachine, P.Q.," will be received at this office until Friday, 15th September, for the several works required for the erection of Post Office, etc., Lachine, P.Q.

Specifications can be seen at the Department of Public Works, Ottawa, and at the Corporation offices at Lachine, P.Q., on and after Friday, 23rd August, 1889, and tenders will not be considered unless made on form supplied and signed with actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party declines the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

WM. H. DICKSON,
160 Waller St., Ottawa.

H. E. DICKSON,

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. Yet have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

DEPARTMENT

OF

Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one *per centum* of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

January, 1889.

PROPERTIES FOR SALE.

Parties having developed or undeveloped mineral lands for sale will find the REVIEW an admirable medium for bringing them before the notice of CAPITALISTS and INVESTORS in GREAT BRITAIN and the UNITED STATES.

Intercolonial Railway
OF CANADA.

The direct route between the West and all points on the St. Lawrence and Baie des Chaleur, Province of Quebec; also for New Brunswick, Nova Scotia, Prince Edward, Cape Breton and the Magdalene Islands, Newfoundland and St. Pierre.

EXPRESS TRAINS leave Montreal and Halifax daily (Sunday excepted) and run through without change between these points in 30 hours.

The Through Express Train cars of the Intercolonial Railway are brilliantly lighted by electricity and heated by steam from the locomotive.

New and Elegant Buffet Sleeping and Day Cars are run on all through Express Trains.

The popular Summer Sea Bathing and Fishing Resorts of Canada are along the Intercolonial, or are reached by that route.

CANADIAN EUROPEAN MAIL
AND PASSENGER ROUTE.

Passengers for Great Britain or the Continent by leaving Montreal on Thursday morning will join Outward Mail Steamer at Rimouski the same evening.

The attention of shippers is directed to the superior facilities offered by this route for the transport of flour and general merchandise intended for the Eastern Provinces and Newfoundland; also for shipments of grain and produce intended for the European market.

Tickets may be obtained and all information about the route, also Freight and Passenger rates, on application to

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

A. M. BURGESS,

Deputy Minister of the Interior.

DUPLEX STEAM PUMP.

SPECIAL STEAM PUMP.

Steam Pumps of the best and latest designs for mining purposes, Boiler Feeding, Fire Protection, and General Water Supply, etc.

NORTHEY & CO.,
Mechanical AND Hydraulic Engineers, Toronto, Ont.
WORKS—COR. FRONT AND PARLIAMENT STS.

INGERSOLL
ROCK DRILL COMP'Y
OF CANADA
MANUFACTURERS OF

Rock Drills,
Air Compressors,
Steam & Horse Power Hoists,
BOILERS,
GENERAL MINING
Quarrying Machinery
Contractors' Plant.

— ALSO —

Drill Steel, Wire Rope,
Derrick Castings,
Steam & Air Hose & Couplings,
Iron Piping, Fittings,
ALL KINDS OF SUPPLIES
—FOR—
Miners & Contractors' Work.

For Estimates, Catalogues and information address

Ingersoll Rock Drill Co. of Canada

204 St. James St., or P.O. Box 1942, Montreal.

FACTS FOR THE FARMER.

AGRICULTURAL FERTILIZERS,
PHOSPHATES,
PHOSPHATIC MANURES.

SUPPLEMENT TO THE CANADIAN MINING REVIEW.
ESTABLISHED 1882.

HAMILTON POWDER COMPANY

Manufacture Mining, Blasting, Military and Sporting Gunpowder, Dynamite, Daulin, and the New Eclipse Mining Powder.

DOMINION AGENTS FOR SAFETY FUSE, ELECTRIC BLASTING APPARATUS, ETC.

OFFICE.—103 St. Francois Xavier Street, Montreal. Branch Offices and Magazines at all Chief Distributing points in Canada.

Important to Miners, Contractors and Quarrymen.

Ingersoll Rock Drill Company, of Canada,

MANUFACTURERS OF

ROCK DRILLS, AIR COMPRESSORS,

Horse Power and Steam Boilers,

Boilers, Stone Channellers, Gadders; also dealers in Wire Rope, Drill Steel, Derrick Castings, Steam Water and Air Pipe and Fittings, Steam and Air Hose, Pumps, Mining Rails, Dump Cars and Buckets; all kinds of Mining and Quarrying Machinery.

Write for Estimates. All information cheerfully given.

OFFICE :—204 ST. JAMES STREET,

MONTREAL.

PIANOS AND ORGANS

STANDARD MAKERS OF THE WORLD.

CHICKERING, STEINWAY,
HAINES, EVERETT,
and NORDHEIMER PIANOS,
ESTEY and KIMBALL ORGANS.

A. & S. NORDHEIMER,

SOLE AGENTS,

69 SPARKS STREET, OTTAWA.

N.B.—A large assortment of good Instruments, slightly used, at greatly reduced prices. Terms very liberal.

THE CANADIAN BANK OF COMMERCE

ESTABLISHED 1867.

Capital, \$6,000,000 - - - Rest, \$700,000.

OTTAWA BRANCH:

R. GILL, - - - MANAGER.

Attention is specially directed to the advantages afforded by the SAVINGS BANK DEPARTMENT established for the convenience of the public at the Branch of this Bank at Ottawa. Deposits of ONE DOLLAR and upwards will be received and interest allowed at current rates.

Deposit Receipts will as heretofore be issued on favorable terms, and current accounts opened, and Loans negotiated, as usual. The Bank offers to its depositors the security of its Paid-up Capital and Rest, amounting in all to Six Million, Seven Hundred Thousand Dollars (\$6,700,000). In respect to Capital the Canadian Bank of Commerce is the second largest on the Continent of America.

Drafts are issued payable in all parts of Canada, including British Columbia, the North-West, and the Maritime Provinces; also drafts on Chicago, San Francisco, and Portland, Oregon, and Hamilton, Bermuda. Drafts are also issued on the Bank's Correspondents in Great Britain and the Continent of Europe, and Letters of Credit for use in all parts of the world.

Having by far the largest number of Branches in Ontario and Quebec of any Bank, exceptional facilities are offered to its Customers and Correspondents for their collecting business.

NOTICE THE FOLLOWING ADVANTAGES

OF OUR

SAVINGS BANK DEPARTMENT:

1. INTEREST is added to the principal at the end of the months of May and November in each year.
2. MONEY bears interest from the date it is left in the Bank.
3. NO CHARGE is made on withdrawing or depositing money.
4. THE DEPOSITOR is subject to no delay whatever.

THE ONTARIO BANK

CAPITAL PAID-UP, - - - - - \$1,500,000
RESERVE FUND, - - - - - 575,000

HEAD OFFICE, - - - - - TORONTO

DIRECTORS:

SIR WM. P. HOWLAND, C.B., K.C.M.G., President.

ORIGINAL DOUBLE ACTING Non-Freezing Force Pump!

Original Force Pump.

With Wrought Iron Adjustable Handles.

With Wrought Iron Adjustable Handles.

Patented Canada and U.S.
LOOK NO LONGER

For water to prime your pumps, or for salt, nor water or
hot irons to thaw them out in winter. Buy our Original
Double-Acting NON-FREEZING FORCE PUMP. They never need priming, never freeze, and are not
liable to get out of repair, have double acting iron cylin-
der, and will throw a barrel of water a minute. We also
make a specialty of pumps for Threshing Machines,
Tanks, Drilled Wells, &c., &c. The superior merits of
these pumps over all others now in use are making a re-
putation that cannot be gainsaid. These Pumps are
offered solely on their merits.

Agents wanted in every county. A liberal commission
given or salaries paid to good men. Write for prices
and discounts. Address

EXHIBITION NUMBER.

Artificial Fertilizers.

By Francis Wyatt, Ph. D.

Chemistry may be described as that branch of science which investigates into the nature and properties of the elements of matter, and determines the manner in which they react upon, and combine with each other. If we hand over a grain of wheat to the botanist, he can discern in it nothing but a tiny, yellow, opaque and brittle seed, whereas, if we pass it to the chemist, he will discover by analysis that it is composed of a woody fibre, starch, gum, sugar, fat and protein. Again; ask a geologist to examine the soil, and he will designate the different ages to which it belongs and the various rocks from which it is derived, but, without the chemist, he is unable to determine the nature of its constituents, and hence cannot foretell, before any cultivation has been attempted, whether it is destined to be fertile, or of what kind of vegetation it is best able to promote the growth.

The application of chemistry to agriculture is thus naturally indicated; by its aid we obtain from the soil, from plants and from animals, at the lowest possible expenditure of time and money, the highest possible quantity of those substances indispensable to our physical well-being.

Production, in order to be cheap, must be rapid and plentiful, and we all know that the progress of unaided nature is methodical and slow.

Chemistry, by investigating the natural laws which govern the development of all living things, and by carefully observing the facts acquired by the practical experience of centuries, endeavours to provide the farmer with means by which he may assist and hasten the processes of nature. His work is, of course, still far from complete, but it has familiarized us with those elements which are essential to plant growth, taught us how those elements are distributed, shewn us what portion of them is or should be contained in our soils, and what soils are most propitious for different kinds of plants.

When our globe was launched into space, it was a liquid somewhat similar in consistency to molten glass, and, therefore, presented a vastly different appearance to that with which we are acquainted. It was made up of about sixty elementary bodies, so deposited, by order of weight or density, that the heaviest, such as gold, silver, lead and copper, were in the centre, while the lighter, such as calcium, aluminum and silicon, remained, and still exist, near the surface, where they have combined to form clays, limestones and sands.

Encircling its interior was a heavy, poisonous atmosphere, comprising all those elements which at a very high temperature assume the gaseous form—notably sulphurous, sulphuric, phosphoric, hydrochloric, nitric, boric and carbonic acids, with torrents of steam, and dense clouds of mercurial, antimonial, arsenical and other metallic vapors. When this mass began to cool, it probably resembled an immense glass ball the solidified sides of which were uplifted by the bubblings of the intensely hot liquid mass within. These solid projections formed our mountains, and, passing from the transparent to the opaque, they gradually assumed the crystalline form. What is known as the earth's crust must have resulted from an extraordinarily forcible action consequent upon the fall of temperature. The vapors already alluded to were condensed into rain. The rain dissolved all the acid bodies, and these acids, attacking the alkaline crust, combined with its most powerful bases to form various salts. These salts soon underwent decomposition; some—such as sulphate of lime or gypsum—were deposited, while others, principally the chlorides, remained in solution and formed the seas. The neutralization of the stronger and more corrosive acids permitted the weaker carbonic acid to develop its activity, and it is this acid which has continued to play the most important part in nature in our own times. Held in solution by the running waters, it attacked and dissolved the various bases which existed in such large quantities in the mountains, and deposited them in the form of carbonates in the still warm valleys. This process of saturation, or neutralization, being entirely accomplished, chemical equilibrium may be said to have become established; the period of great geological catastrophes, therefore, came to an end, and the temperature of the earth gradually sank below the boiling point. A few volcanic disturbances continued, it is true, to occasionally convulse it; there was the upheaval, splitting asunder and complete overthrow of the most gigantic mountains, the drying up and the division of seas, and the formation of lakes of both fresh and salt water. As the temperature continued to cool, however, these disturbances became more and more rare, and there then commenced that formation of the soil which gave rise to the phenomena of vegetation.

VARIETIES OF SOIL.

It is the general custom to class arable lands according to the nature of their predominating constituents, and thus we allude to soils as sandy, clayey and limey.

Sandy soils are distinguished by their extreme porosity, and are frequently in such a fine state of division, that in the dry season the least wind will displace and scatter them in all directions. In such cases they are naturally sterile; but, when they are sufficiently moist, they facilitate and encourage the growth of an immense variety of plants of the lower order, which, by their eventual decomposition or putrefaction, form considerable

deposits of that valuable substance called humus.

Such soils are more propitious than any others for the development of plants with very delicate or fine roots, such as barley, rye, oats, lucern, lupins, lentils and potatoes; but they require constant attention, and a large and regular quantity of manure, because their porosity permits them to absorb such an abundance of oxygen, that all their organic matter is rapidly burnt up.

Clayey soils are heavy and compact, and, when they contain more than fifty per cent. of pure clay, are onerous to work, and unprofitable to cultivate. It has, however, fortunately been discovered that the addition to them of so small a quantity as two per cent. of burnt lime suffices to so entirely change their nature and consistency, by transforming the silicate of alumina into a porous silicate and aluminate of lime, that it is now an easy matter in districts where lime is cheap and plentiful, to overcome this difficulty. In hot countries or in windy regions or in districts where the sub-soil is of a very permeable character, good clay lands offer great advantages, and although they periodically require the application of large quantities of reconstituents, they possess the faculty of retaining all the precious elements supplied to them, and of storing them up for the use of successive crops. When they contain a proportion of about ten per cent. of carbonate of lime, or chalk, they are the best of all soils for the extensive growth of such important plants as wheat, corn, clover, hemp, peas and beans, and of such trees as the chestnut and the oak.

Limey, or purely calcareous, are even lighter than sandy soils, and when, as is sometimes the case, they are very white and dry, they are absolutely barren. Such as these are, however, easily encountered, for we generally find them mixed with a sufficiency of clay to give them some degree of consistency, and render them available for ordinary purposes. Few soils are entirely devoid of lime, owing to the fact that all rocks contain it in greater or lesser proportion, and because it is transported in immense quantities by waters, in the form of bi-carbonate, and deposited. If it were otherwise, or if, in the absence of lime, other alkaline substances were not forthcoming, the acid principles secreted by all plants could not be saturated, and the inevitable result would be decomposition and death. In its pure form, however, lime is such an extremely strong base, that it is incompatible with life, and hence it is never allowed to exist in the soil, unless it be combined either with carbonic or silicic, or sometimes with sulphuric and nitric acids.

The general properties of every variety of soil are much influenced by colour; those which are white, and hence unable to absorb the solar rays, being invariably cold, whereas those which are dark are warm and fertile. In this regard both iron and manganese are of undisputed

value, for by their transformation into ferric and manganic oxides, they produce the deep red or brown so much admired by sagacious farmers. In damp climates or in very moist soils, however, too much iron is apt to become a source of considerable danger, from the fact that, by the exclusion of air, the ferric is reduced, by its affinity for water, into ferrous oxide, and in that form exercises a highly corrosive action on vegetable life.

ELEMENTS OF PLANT LIFE.

Sixty years ago there was no such thing as what we now call scientific agriculture. In the old countries men were asking themselves the very question that faces us to day—how it is that lands which were once so fertile and productive now show signs of approaching exhaustion. The answer to this question could only be given after we had found how out-door plants live, whence they obtain their food, of what elements that food is composed; how it is conveyed to the plants and how they absorb it into their organisms. In point of fact the manner of life in plants is very similar to the manner of life in animals and man. They require certain foods in stated proportions which pass through the process of digestion; they must breathe a certain atmosphere and they are subject to the influences of heat and cold, light and darkness.

The tissues of their bodies, like ours, are composed of carbon, hydrogen and oxygen, and contain besides nitrogenous principles, certain minerals, such as phosphoric acid, lime, potash, sulphur, magnesia and iron. It will be seen at once that if it is necessary for us to constantly absorb a sufficiency of these self-same elements to keep up our normal heat and provide us with new tissue, it must be no less essential for plants to acquire similar food, for similar purposes.

Pure atmospheric air is a mixture of nitrogen and oxygen, with a small proportion of aqueous vapor, and about 4-10,000th of carbonic acid, while water is formed by the combination of two parts of hydrogen and one part of oxygen. It is therefore apparent that the principal organic elements of plant food exist in the atmosphere as air, water and charcoal, and may be absorbed from without by the leaves, while the whole of the mineral bodies in order to be found in the soil, should be taken up from within by the roots.

How plants absorb and elaborate the inorganic matter necessary to the food of those graminiferæ which afford to man the bulk of his animal sustenance, or what process is undergone in the assimilation of carbon, hydrogen, oxygen, and nitrogen, which, in the form of carbonic acid, water and ammonia, or nitric acid, are taken from the air and the soil, we have no space to discuss; but, it will be interesting to quote a very beautiful and practical illustration of the contrast between them and ourselves, furnished by Dumas.

Vegetables.	Decompose Produce.	Man and Animals.	Consume Produce.
{ Nitrogenous Matter, Fatty Matters, Gum, Sugar, Starch.	{ Carbonic Acid, Water, Ammonia.	{ Nitrogenous Matter, Fatty Matters, Gum, Sugar, Starch.	{ Carbonic Acid, Water, Ammonia.
Evolve oxygen, constitute apparatus of reduction and are stationary.		Absorb, oxygen, constitute apparatus of oxidation and are locomotive.	

The consideration of this remarkable contrast leads us to contemplate the progressive exhaustion of the soil, and the necessity for its reconstitution by the aid of chemistry, for, while admitting that *we produce those very elements* which the plants decompose, and which are so necessary to their existence, it is nevertheless a fact that *we are locomotives, and do not in practice give back to them what we have taken away.*

The elementary composition of plants being thus determined, the next step that suggested itself to investigators was the analysis of the soil, in order that comparisons might be established between virgin lands which had borne no cultivated crops and old soils which had long been tributaries to every kind of vegetable culture.

Briefly stated, it was found that good, ordinary young lands, contain in abundance most of the dominating ingredients discovered in plant organisms, and that soils which have long been under cultivation, and now show themselves incapable of their former remunerating production, only contain these dominants in minute proportions, or lack them altogether.

These data form the basis of our present science, and may be summed up in the following manner:

A. Plants require for their nourishment and prosperity a given quantity of food, composed in varying proportions and according to their different natures, of hydrogen, oxygen, nitrogen and carbon, and of phosphates, sulphates and chlorides.

B. The hydrogen and oxygen, in the form of rain or dew, are supplied as water, and the carbonic acid is mainly derived from the air.

C. Good virgin soils contain the whole of the necessary minerals, in addition to considerable quantities of nitrogenous and carbonaceous matter.

D—Long-cultivated and non-productive soils may be termed exhausted, since chemical analysis *proves their inability to furnish the needful substances in quantities equal to those found in the ashes of healthy plants.*

FERTILIZERS AND AMENDMENTS.

Having arrived at this important stage of progress we understand that, if agriculture is to continue to be the basis of national wealth and prosperity we must find means of restoring to our soils, if not in a natural in some artificial form, the chief elements yearly taken away from it by our crops—we say *chief* elements because

a great number of the necessary minerals are only required in very minute proportions, and therefore generally exist in sufficient abundance. We may consequently disregard all these, and devote our attention to nitrogen, potash, phosphoric acid and lime, since these not only play the most important part in the functions of vegetation but are the most liable to complete exhaustion. The following figures representing averages compiled from the official reports of the United States Department of Agriculture extending over a series of years, will be found very *à propos* for the purpose of illustrating the arguments already put forth.

ELEMENTS OF FERTILITY TAKEN FROM THE SOIL PER ACRE AND PER ANNUM, IN POUNDS.

—	Nitrogen.	Lime.	Phosphoric Acid.	Potash.
Wheat.....	25	15	30	45
Maize.....	55	45	80	40
Oats.....	30	14	18	20
Barley.....	35	12	18	20
Rye.....	25	13	25	35
Buckwheat.....	35	12	40	38
Hay.....	40	40	15	40
Tobacco.....	not calc'd.	160	not calc'd.	340
Turnips.....	do	100	45	150
Potatoes.....	44	60	52	185

These are, of course, only a few examples, but they will suffice for present purposes, and it is perhaps hardly necessary to add that if, according to the nature of the crop desired, at least a sufficient proportion of each of these essential elements be not present in the soil, the plants will languish, various malignant diseases will declare themselves, and death will inevitably ensue before they reach maturity.

Now, the practical question that must naturally arise, is, how may all this loss be repaired, and whence are all the elements needed to repair it to be derived? It is not so very long ago since this question would have been generally answered by the words, "farm-yard manures," and even to-day there are a large majority of farmers who depend exclusively upon this valuable fertilizer.

The fallacy of their policy is, however, made apparent by a simple calculation, which any interested reader can work out for himself, in this wise.

The necessary elements to the growth of a medium crop of hay have been put down, approximately, per acre, as:—

Nitrogen.....	40 pounds.
Lime.....	40 "
Potash.....	40 "
Phosphoric acid.....	15 "

The very best farm-yard manure is found to contain, on an average, for every hundred pounds, exclusive of water and fibre:—

Nitrogen.....	not quite $\frac{1}{2}$ pound.
Lime.....	little more than $\frac{1}{2}$ "
Potash.....	about $\frac{1}{2}$ "
Phosphoric acid.....	(say) $\frac{1}{4}$ "

With a very moderate allowance for loss in storage, drainings, evaporations, etc., it must be conceded from these figures that to repay what has been borrowed from the soil by a single crop of hay would call for some six tons of material per acre; and there is probably only a very limited number of farmers—even if there are any—who could produce anything like this quantity. The practical answer to the question propounded, therefore, is that we must profit by the teachings of science and turn to artificial or chemical fertilizers as the only means of avoiding present loss and eventual poverty. This leads to a brief glance at the most accessible materials, and the forms in which they are most appropriate for the requirements of growing plants.

NITROGEN.

The sources and the supplies of nitrogenous elements, outside the free nitrogen and the ammonia that exist in the atmosphere, are numerous and plentiful. Every species of plant, roots, stalks, leaves and seeds yield it up in varying proportions, under the influence of decay. The refuse or waste from an average crop of clover contains about fifteen pounds of assimilable nitrogen per acre, and some of the other green crops are so rich in this element that it has become customary to occasionally grow them for the express purpose of plowing them under directly they have reached maturity. Outside the farm, we have guano, fish, wool rags, horns, hoofs, hair, blood and all other animal refuse from the slaughter-house, and, failing a sufficiency of all or any of these, there are the nitrates of soda and potash, and sulphate of ammonia.

The following are about the proportions of nitrogen contained in every 100 pounds of some of the foregoing materials:—

100 lbs. shoddy	contain	7 lbs. nitrogen.
100 " wool dust	"	9½ "
100 " dried blood	"	12 "
100 " rope cake	"	5 "
100 " cotton	"	5½ "
100 " sugar scum	"	3 "
100 " leather cuttings	"	8 "
100 " sul. ammonia	"	21¼ "
100 " nitrate of potash	"	13¾ "
100 " " soda	"	16½ "

POTASH.

We have seen that the quantity of potash absorbed by the most important of our crops is greatly in excess of phosphoric acid. It may consequently be assumed that continued fertility depends upon a preponderance of this important base. This, nature has in a great measure provided for, by promoting the continuous decomposition of feldspathic and other rocks, and by favouring the transfer of potash in the various forms of silicates, carbonates, and oxides from the subsoil to the surface.

When all these varieties fail, however, it is easy to secure inexhaustible supplies from the nitrates and chlorides, which are either deposited in various localities on the surface, or in the interior of the earth's crust, or held in solution by the waters of the sea.

Potash salts, to be readily assimilable, or

useful to the plant, must be liable when introduced into its sap, to so easy a decomposition, that their liberated alkali may enter at once into the necessary combination with the organic compounds.

If, as it is applied, the potash be united to its acid by too strong a bond, the vegetable will be unable to effect a dissociation; and the salts will accumulate in the tissues, and become a mere burden instead of promoting healthy growth.

This question of assimilation, therefore, is one that demands very attentive study; and it is from the data collected by the most recent scientific discoveries in relation to the laws and powers of affinity, that the various salts, according to their adaptability, have been classed in the following order:

Carbonate,	Sulphate,
Nitrate,	Chlorides.

The amount of potash contained, in round figures, in each of these salts when pure is as follows:

100 pounds Carbonate contains 68 pounds of potash.

100 pounds Nitrate contains 46½ pounds of potash.

100 pounds Sulphate contains 54 pounds of potash.

With regard to the chlorides, which are compounds of chlorine and *potassium*, it is necessary before they can furnish anything available that they should undergo a preliminary decomposition in the soil, but it may be assumed that when this has taken place, every 100 pounds of the pure chloride would be equal to about 63 pounds of potash.

On the assumption that neither the sulphate of potash, nor the chloride of potassium is directly assimilable by plants, their efficacy must depend upon the composition of the soil under treatment, and the character of any other fertilizers with which they are simultaneously used.

To illustrate this it is only necessary to imagine a mixed fertilizer containing in suitable proportions, superphosphate of lime, sulphate of ammonia, and muriate of potash.

As soon as this compound reaches the soil, a reaction is commenced between the whole of the salts, resulting in the production of phosphates of ammonium and potassium, and sulphate and chloride of calcium.

The two latter will be washed down into the subsoil by the rains and carried away, while the two first will enter the roots, and be very readily decomposed in the sap, and utilized by the plant.

If, instead of the above, a mixture be chosen of nitrate of soda, and either the muriate or the sulphate of potash, a similar transformation will take place; chloride or sulphate of sodium being produced on the one hand, and nitrate of potash on the other.

Dispensing with unnecessary reiteration, these typical examples sufficiently illustrate the importance and advisability of making preliminary

trials upon a small scale, with each salt, in every case where the use of potash has been determined upon, since, under the varying influences of the different elements in every soil, uncertain and unlooked-for results may be obtained.

PHOSPHORIC ACID.

This indispensable fertilizing agent is probably the one in which all cultivated soils are most deficient, and, to make matters still more complicated, its occurrence though so plentiful in nature, is found to be most unequal.

It does not exist in the atmosphere; soils of the granitic and tertiary formations are nearly deprived of it; and many other species only contain it in very slight traces.

The following are the principal and most available commercial sources of phosphates for agricultural purposes, viz.:

First, Natural phosphates, of animal or mineral origin, such as bones, bone-ash, and apatites very finely ground.

Second, Superphosphates, manufactured by treating these raw materials with a sufficient quantity of sulphuric acid to transform them from an insoluble into a soluble form.

Third, Precipitated phosphates, obtained by dissolving raw phosphates in hydrochloric instead of sulphuric acid, and adding to the liquid a milk of lime.

From which of these forms the most direct advantage is to be obtained by the farmer, is a somewhat disputed question. Accepting the generally admitted and rational theory, that no element can penetrate into the interior of a plant unless it be in the form of solution, it naturally follows that preference will be invariably given to those commercial phosphates which are most readily subject to dissociation; and this will entirely depend upon two conditions:

(a) Their own degree of aggregation.

(b) The nature and composition of the soil in which they are employed.

The first thing to be obtained is undoubtedly a fineness of pulverization, which will so divide the molecules as to render them easily decomposable by the natural action of the elements contained in the ground, and in this only partial success has been achieved by mechanical means. So long ago as 1851, Leibig recognized the difficulty, and proposed, in order to solve it, to chemically perform this operation by manufacturing superphosphates.

From the standpoint of disintegration, this method has been entirely satisfactory, and has enabled agriculture to rapidly obtain results from the use of phosphoric acid, which would otherwise have been impossible. From a chemical point of view, however, the whole theory fails. We know that superphosphates are only soluble in water so long as the sulphuric acid with which they have been manufactured retains its ascendancy over the lime, and that when they reach the soil, especially where carbonates are in abundance, the sulphuric acid is at once overpowered. The phosphoric acid, being

unable to exist in a free state is taken up by the lime and iron and at once reverted to a tribasic form. In other words the whole question is one of time, and of dollars and cents.

The farmer buys a ton of raw phosphatic material finely ground, and containing say twenty-five per cent of phosphoric acid for \$10. If his land contains neither humus nor acid elements, nor a sufficiency of lime, the phosphate will not decompose and he will have to wait perhaps several years before obtaining any appreciable results for his outlay. On the other hand he buys a ton of superphosphates, containing only fourteen per cent. of phosphoric acid for \$20 and applying it to an exhausted soil, producing the desired results on his very next crop. Hence it is apparent that the phosphoric acid of the latter is more assimilable than that of the former case; and this assimilability can only be due to the absolute state of division insured by the series of decompositions to which the raw phosphate is exposed during the manufacturing process. To define with scientific accuracy the exact merit or intrinsic value of any specific phosphate, is a matter of very serious difficulty; since, besides that of its own physical conditions, so much depends upon the nature and composition of the soil in which it is to be employed. No better examples of this truth could possibly be found than the preliminary comparative experiments, conducted during the past two years, with raw basic slag, and various other phosphatic materials; for they have so far proved, that whereas, in some soils the effects produced by crude phosphates fairly rival those obtained with superphosphates, in other soils they are either quite inert or insignificant in their action.

LIME.

All farmers are familiar with the use of lime, but it is doubtful whether many of them know the exact reasons for its application or clearly understand its influence. It may therefore be broadly premised that the objects for which it is employed are two in number.

First. To exercise a chemical action upon the numerous constituents of the soil, and thereby produce a complete modification of its physical and chemical properties.

Second. To furnish it with the quality required by plants for their alimentation and growth. From the figures already given it will occur to the reflective mind that, regarded as a plant food, lime is of less direct importance from a commercial standpoint than either nitrogen, potash or phosphoric acid.

Placing the total quantity yearly removed by crops at an average of 50 pounds per acre a soil need only contain say, half of one per cent. to supply all that could be demanded of it during several hundred years.

Its true agricultural value must consequently be attributed to its qualities as an amendment rather than a fertilizer.

The term "amendment" has been given to substances which, when they are applied to a

soil, effect a change in its general constitution, and thus lime, when mixed into strong, stiff and unworkable soil

a ten to fifteen tons to the acre induces in them a far-reaching chemical decomposition, which, in addition to partially transforming them into the more porous silicates and aluminates of lime, sets free large quantities of alkaline salts that were previously unable to co-operate in the phenomena of vegetation because bound up in insoluble combinations.

This marvellous effect would of itself create for lime a very high place in the estimation of farmers; but it by no means represents the total scope of its usefulness, as will be clear to those who recall its properties as a generator and promotor of combustion. The accumulation of vegetable remains in various stages of decay and putrefaction, left in the ground by the crops or intentionally plowed under for the purpose, results in the production of a body known as humus. If left to itself this body would so acidify the soil as to destroy its normal basic or alkaline reaction. It could consequently no longer afford nourishment to any of those plants which generate the elements of animal food. In order to successfully cultivate such lands it is therefore necessary to neutralize their acidity; render them alkaline, and remove the excess of these organic matters.

All these conditions are perfectly fulfilled by burnt lime. The word "combustion" designates that process by which an organic body principally composed of carbon and hydrogen, with traces of nitrogen, unites with the oxygen of the air to form oxides. Thus, coal, coke, wood and vegetable refuse, although burnt to create heat, and apparently thereby destroyed, in reality merely undergo a chemical change, arising out of that scheme of nature which has provided for the restoration of all their constituents to the atmosphere and the soil.

The carbon continues with the oxygen of the air to form carbonic acid gas; the hydrogen and nitrogen, momentarily set free by this action, unite themselves together to form ammonia; while the ash consists of oxidized mineral matters.

With the exception of fluorine, every element combines with oxygen to form oxides, and in doing so develops more or less heat. The warmth of the animal body is created and sustained by the oxidation of the starchy or fatty or carbonaceous elements of food; and, hence, while animals breathe in oxygen, they breathe out carbonic acid, gas and steam. When this natural chemical process is stopped, the animal dies; or, to speak more forcibly, when no more food is provided, or no more oxygen inhaled, the internal fire ceases to burn, and everything grows cold.

This is but a brief definition of combustion. It, however, suffices to establish that oxygen is the promoter of the phenomenon, and hence to explain that, if great masses of decaying humiferous matters sometimes linger in soils, it is

because the latter are cold and wet and have become so choked up and cohesive as to preclude a proper circulation of air.

Oxygen is thus unable to reach them until they have been warmed, dried and made porous. Burnt lime, when properly administered, accomplishes all these objects.

By its great affinity for water and the intense heat of its combination, all moisture is absorbed. The rapidly drying soil cracks and opens up in every direction, and free ingress being thus afforded to the air, a vigorous and permanent combustion sets in.

Attacked in its turn by the carbonic acid gas resulting from the combustion process, it is converted into carbonate of lime, and, alkalinity being thus gradually restored, the plough completes the conquest, and barren wildernesses become fertile plains.

Reviewing these effects and briefly summing up its advantages, it will be seen that, independently of its power to impart porosity and to facilitate combustion, lime sets free various alkaline salts from useless combinations, and renders them available as plant-food. It also decomposes certain injurious salts of iron, magnesium and manganese, counteracts the evil influences of all kinds of sulphurous emanations, and, before being transformed into carbonate, destroys, by its causticity, vast quantities of ravaging insects and their eggs.

Despite these great advantages, it must be noted that the indiscriminate use of this powerful oxidizing agent on good ordinary cultivated soils would be productive of disaster.

Lest this statement be regarded as conflicting, it is explained that a good soil is what has been described as a mixture containing all the elements required for plant-food, in a proper physical condition, and with a due proportion of humus or organic matter. This humus is of the utmost importance.

First. Because, by its very slow oxidation or combustion it helps to maintain the warmth of the soil.

Second. Because it contains a considerable quantity of nitrogen, which is gradually transformed by this slow combustion into ammonia or nitric acid and nitrates.

Third. Because it has the invaluable property of always retaining moisture, and thus can enable plants to withstand periods of drought which would otherwise kill them.

However rich it may otherwise be, it has been demonstrated, by experiment, that no soil is perfect which contains less than two per cent. of humiferous matter.

This is why scientists untiringly urge upon farmers to provide for its maintenance by using in addition to artificial fertilizers all the farmyard manure they can scrape together and to carefully plough under, instead of burning, as they are so prone to do, all the refuse from their crops.

The imperative necessity of this duty is intimately connected with the most complicated

ESTABLISHED 1858.

THE
Morrisburg Implement Works

Patented Dec. 17th, 1885.

Patented Dec. 17th, 1885.

THE "NEW MODEL" ROTARY DISC
JOINTED PULVERIZING HARROW.

Effective in Work, Simple in Construction,
Durable in Wear, Convenient in Handling.

Progressive farmers say that it is the very best farm
implement ever produced.

We specially request every one who contemplates purchasing a Harrow of any kind to test and compare the working of these harrows by the side of any harrow or Cultivator on the market. It will pay you to do so. See one, try one, buy one and be happy.

THE "SPEED"

ROOT AND PUMPKIN CUTTER

(Patented February 2nd, 1887.)

The Simplest, Fastest Cutting and Easiest
Running Cutter in the Market.

We have pleasure in drawing your attention to this new principle in a Root Cutter. This cutter has ten knives attached to a cylinder set diagonally, each acting independently of the others; thus every revolution of the cylinder cuts ten slices, giving a very fast cutter with very little power required. One man can easily cut 1½ bushels of roots per minute. We are making all cutters with pulley so they can be run either by belt or hand. We make this cutter with either 12, 15 or 18 inch knives.

THE WARRIOR MOWER.

The great many years it has been in successful use in the field has proved it to be superior in mechanical construction, lightness of draft, ease of management, durability and capacity to do good work under all circumstances. Write for circulars and testimonials from leading farmers. Agents wanted in all sections not already occupied. Address J. F. Millar & Son, Lock Box 35, Morrisburg, Ont.

THE STIRLING

High Pressure Boiler

MANUFACTURED BY THE

Dominion Safety Boiler Co.,

(LIMITED),

31 Wellington Street,

MONTREAL.

The Safest, Most Durable, and most Economical
Boiler yet Invented.

The large incandescent fire brick furnace causes perfect combustion of any kind of fuel, hard coal, soft coal, slack coal, cordwood or sawdust. The large mud drum collects all the impurities from the water. Made entirely of best wrought metal, no cast iron used. There can be no unequal expansion, as the mud-drum falls and rises as the tubes expand and contract. The removal of three manhole covers gives easy access to every part of the interior of the drums, and to both ends of every tube.

Dry Steam guaranteed.

A PERFECT FOOD

This statement is made upon the results of scientific analyses by the best chemists in the world. FRANCIS WYATT, Ph. D., Analytical Chemist, New York, after giving an exhaustive analysis, says:—"Here we have the whole of the elements, without a single exception, necessary for the formation of flesh, muscle and bone."

JOHNSTON'S FLUID BEEF

Is not a mere meat extract or a concentrated decoction, but simply fluid beef, containing, besides the albuminoids and gelatinoids, the correct proportion of those phosphates so essential to the support of life.

F. W. MASON,
PIANO TUNER,
REPAIRER AND REGULATOR.
Ottawa and surrounding Villages.

Address

Cumming's Bridge, Ottawa, Ont

Dominion of Canada

FREE FARMS FOR MILLIONS

200,000,000 Acres

Wheat and Grazing Lands, for Settlement, in

MANITOBA AND CANADIAN NORTH-WEST.

Deep soil, well watered, wooded and richest in the world—easily reached by railways. Wheat—average 30 bushels to the acre, with fair farming.

The Great Fertile Belt

Red River Valley, Saskatchewan Valley, Peace River Valley, and the Great Fertile Plains, Vast Arcas, suitable for Grains and the Grasses, largest (yet unoccupied) in the world.

VAST MINERAL RICHES—GOLD, SILVER,
IRON, COPPER, SALT, PETRO-
LEUM, Etc., Etc.

IMMENSE COAL FIELDS—ILLIMITABLE
SUPPLY OF CHEAP FUEL.

Railway from Ocean to Ocean!

ROUTE—Including the great Canadian Pacific Railway, the Grand Trunk Railway, and the Intercolonial Railway, making continuous steel-rail connection from the Atlantic to the Pacific Ocean through the great Fertile Belt of North America and the magnificently beautiful scenery of the North of Lake Superior and the Rocky Mountains.

New Route from England to Asia, wholly through British territory, and Shortest Line through America to China, Japan, Australia and the East. Always sure and always open.

Climate the Healthiest in the World.

The Canadian Government gives Free Farms of 160 acres to every male adult of 18 years, and to every female, who is head of a family, on condition of living on it, offering independence for life to every one with very little means, but having sufficient energy to settle.

Further and full information, in pamphlets and maps, given free on application by letter, post free, addressed to Department of Agriculture, Ottawa, Canada, or to High Commissioner for Canada, 9 Victoria Chambers, London, S. W., England, and all Emigration Agents.

Ottawa, September 2nd, 1889.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter
with original bores of 3 and 3½ inches,
bushings to be used for intermediate sizes;
larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.
22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to THE DODGE WOOD SPLIT PULLEY CO., TORONTO.

USE GURNEY'S IMPROVED CELEBRATED Hot Water Heaters!

Guaranteed more Economical than any other
Heater now made, and containing every
known Improvement in Hot
Water Heating.

STEAM FITTINGS, CAST IRON PIPE,
REGISTER, GRATES, ETC.

HOT AIR FURNACES
FOR COAL OR WOOD.

Bundy Radiators for Quick Circulation and Economy of Space.

problem yet remaining to be solved by agriculturalists, (i.e.) whence to obtain sufficient assimilable nitrogen to integrally replace what is taken from the soil by the crops, and exported with them to foreign countries every year, without having recourse to any of the costly commercial substances already enumerated.

The pet theory—so beautiful as a theory—of obtaining it directly from the air, in a suitable form, and at a fabulously cheap price, continues to occupy many clever brains in many scientific laboratories, but is still as far as ever from a practical solution; on the other hand since it has been proved that nitrification chiefly results from the extremely slow oxidation of organic matter in alkaline soils, it naturally follows that so long as there exists a sufficiency of humus under favourable conditions, no dearth of available nitrogenous plant food need be apprehended.

Unfortunately, the immense amount of exportation, combined with misconceived notions of sanitation, prohibit all hope of restoring to the lands the whole of the required nitrogen in an organic form. It is consequently all the more necessary to manipulate what remains in a spirit of economy; to handle the soil with delicacy, care and intelligence, and above all things, to avoid introducing into them any substance which may interfere with their normal, regular, and natural functions.

The Application of Ground Phosphates.

Prof. Arthur R. Guerard.

With the appearance of Liebig's book, "Chemistry in its applications to Agriculture and Physiology" (1840), may be said to have begun a new era in the art of culture. To Liebig we are indebted for the right understanding of exhaustion and restoration in agriculture, the neglect of which had converted many once fruitful districts into hopeless deserts. It was Liebig who pointed out that the inorganic elements of plant-food in the soil were the most important, the easiest exhausted, and that their constant removal in the harvest was, notwithstanding the rotation of crops, and the then usual system of manuring, a robbery of the soil, which enriched the present at the expense of the future. This was the so-called "mineral" theory, to which was opposed the "nitrogen" theory, giving the chief value in the nourishments of plants to the organic substances, the nitrogen products. In the controversy which ensued, the results obtained under Liebig's system at the numerous experimental stations and confirmed in general farm practice eventually drove the nitrogen theorists out of the field. The restoration to the soil, upon scientific principles, of the constituents taken from it thus founded a new and increasing industry, the manufacture of commercial fertilizers, in which the opening up of extensive deposits of potash, salts, and phosphate of lime took an important part. Justus Von Liebig may, therefore be rightly called the founder of the high art of culture.

But in acknowledging all that is due to this illustrious chemist, and admitting that his views were generally correct, it cannot be denied that he was sometimes more suggestive than conclu-

sive, while his principles, having unfortunately been accepted on faith, have led, in some instances at least, to false conclusions. Remarkably has this been the case with the application of vitriolated or superphosphate of lime, the manufacture and employment of which have now assumed such vast proportions, that it is fitting some investigations were made into the principles which govern its use. But before entering into this subject perhaps it may be well, for the sake of clearness, to give some general idea of the food requirements of plants and the nature of manure, in which I crave indulgence of those whom I may take over old ground.

Plants require for their complete development organic and inorganic elements, of which they consist. One part of these is afforded by the atmosphere, the other by the soil. The latter are left as ashes on burning, while the former go off in gaseous form. The inorganic, incombustible elements are: potash, soda, lime, magnesia, phosphoric acid, sulphuric acid, and iron; the organic, volatile elements are carbon and nitrogen. Plants receive carbon in the form of carbonic acid and nitrogen in the form of nitric acid and ammonia; these last being furnished directly or indirectly from the atmosphere, while the soil must contain all the necessary mineral constituents in a proper physical condition for plants to grow and thrive upon it. The fundamental conditions, therefore, for plant production are given in the air and soil.

The circumbient air is the mediator of heat from the sun, climate being the first factor in plant growth. The other no less important factor, is the soil. Soil is formed from the disintegration of the rock masses in the earth's crust in various ways, by the action of the air and meteorological appearances—weathering; by the force of water and ice, and finally by volcanic causes, as they are still active in some countries. In general, the formation of soil is not to be considered as complete, but on the contrary as continuing unceasingly and evident everywhere. The soil for the most part consists of inorganic with a small proportion of organic constituents, such as vegetable and animal remains. Formerly these last, so called *humus* were considered to be the active agents in the nourishment of plants and a soil was valued according to the quantity of *humus* it contained. But this view has been abandoned. We now know that the inorganic elements in the soil are the essentials of plant food.

All kinds of soil contain a certain number of chemical bodies, which may be considered as constant parts in soil, such as silica, alumina, lime, magnesia, potash, soda, iron, and partly combined with these, carbonic acid, phosphoric acid, sulphuric acid and ammonia; finally water, which occurs both in chemical as well as mechanical combination. Besides these we find other chemical bodies in soil, but in smaller quantity and without special importance for vegetation. But it is only with the upper layer of soil and under certain conditions with the sub-soil that the agriculturist is concerned.

This vegetable layer contains a certain amount of plant food, which, by the continued removal in the harvest, is gradually but entirely extracted. It is for this reason, therefore, in order to keep up the productive power of arable soil, that the renewal of such substances as serve the purpose, and which the harvest has removed, is necessary. This restoration is manuring. Now, when a plant is burnt, a great portion of its elements passes off in gaseous form, while a part remains as ashes. The most important ash elements are lime, potash and phosphoric acid; volatile elements, carbonic acid and ammonia. The soil

must contain, or be able to develop, all these to be fruitful. Not every plant, however, demands one and the same quantity of nourishment; one requires more potash, another more lime, a third more phosphoric acid, but all plants need a portion of all of these elements together, and if one of them only is wanting the plant cannot thrive. Thus, it may be that so great a quantity of the most of these nutritive elements is present in a soil that a continued cultivation is not able to exhaust it; but of others, on the other hand, particularly phosphoric acid and potash, the quantity may be so small that it may well be consumed by repeated harvests. At the same time it is necessary that the manurial plant food should be present in such a form in the soil that it is accessible to the plant; that is, not only in chemical, but in suitable physical combination. Thus, in supplying the nutritive elements of plants in the form most favorable for absorption and assimilation consists the whole art of manuring.

As a matter of course, the restoration must be made in such a manner that the results warrant the outlay; in other words the object is to return to the soil as manure, in the form of worthless or cheap material, these elements which, in the form of valuable, saleable, or useful materials, have been taken away in harvest. The experience of 2,000 years has taught that this restoration cannot be better made than in animal and human excrements. Especially is this the case with stable manure, in which such excrements are mixed with straw, which has generally fulfilled the demands so completely that no substitute of like value has as yet been discovered. It contains the mineral elements of plant food in a condition most favorable for this absorption and assimilation by the plant; the fermentation which takes place in the soil is the fountain of ammonia and carbonic acid, which serve not only as food in themselves, but assist in decomposing other elements found in the soil. By means of this decomposition, accompanied by the generation of gas, heat is produced, and also a favorable mechanical condition of the particles of soil. Yet, nevertheless, stable manure, together with its liquid portion, does not return to the soil in sufficient quantity all the nutritive elements which have been extracted from it, as long as its production is confined to the farm-yard, and not supported from without. Moreover, stable manure does not always contain the two most important inorganic elements of plant food, phosphoric acid and potash, in the right relation for plant production. Upon these grounds the increasing cultivation of the soil and the needs of mankind demand the employment of artificial fertilizers along with, or as a substitute for, farm-yard manure. The important plant food elements act always together; that is to say, each one helps toward the increased power of assimilation of the other by the plant; so that by the employment of one, and one only, by no means will the effect produced upon the plant be in proportion to the quantity of this element used. For example, if a potash fertilizer be used on a soil poor in potash the plants growing on that soil would take up not only a greater percentage of potash, but they would also take up all the other elements in proportion to the addition of potash. The harvest, therefore, from a soil to which potash had thus been added extracts more of the necessary nutritive elements altogether than a harvest from a soil to which no potash at all had been added would do. If, then, a field, and the plant life on it, be always supplied with one and the same food element all the others, consequently, by the help of its

action, would be gradually consumed and the field become unfruitful; that is, it would no more possess all the mineral substances out of which the plant body is built up. This condition lasts until efficient manuring or a renewed decomposition of some undecomposed mineral by the action of the atmosphere furnishes a sufficient quantity of available plant food. But it is not possible in all kinds of soil, by this last means alone, that is, by letting the land rest or fallow, to effect a restoration. Many elements, as phosphoric acid and potash, may be so entirely absorbed out of the soil that a natural restoration is not to be thought off at least only after an indefinite period. This is the cause to which the desolation and barrenness of so many regions is to be attributed, and not to imaginary climate changes or decrease of population. The careless indifference to the relation between exhaustion and restoration may, therefore, be well called a robbery of the soil; for here the present lives on the capital which a long past has heaped up in the soil, but which without or within sufficient restoration must, in a short time, be entirely consumed. To prevent this in a judicious manner, to keep the land ever in a uniform condition of fertility, and to win from it a satisfactory interest, is the duty of the agriculturist. He can only solve this problem in a cultivated land by a rational and scientific system of manuring. Turning now to the main subject of my essay, if any of the delicate membranous parts of plants—the leaves, the stems, the roots—be examined under the microscope they will be found to consist of innumerable small hollow spaces, called cells. These cells are inclosed by a thin skin or membrane, and contain a fluid giving an acid reaction. This is a well-known fact; but it may be easily proved by pressing the root-fibres of any fresh young plant on a bit of blue litmus paper. The paper will be reddened, owing to the disengagement of malic, acetic, citric, or other vegetable acid. Now, by the laws of chemical affinity, this acid demands and combines with a base.

Hence when any of the necessary nutritive elements of plants, as phosphate of lime, in a sufficiently fine state of division, are brought into contact with the cells of the root, the acid in the cells will strive to overcome the obstacle presented by the inclosing membrane, and unite with the base. And this can be visibly demonstrated; for if a glass vessel be filled with the juices of the plant or, which is the same thing, with distilled water containing acetic or other vegetable acid, and a bladder tied over it in such a manner that it touches the liquid, and then a little finely powdered phosphate of lime placed upon it, in the course of a short time the powder will be seen to have disappeared in solution through the pores of the membrane. But if this can be shown in the laboratory, how much more powerful must be the action of the living plant in nature when such powder is brought into contact with the membrane of the cells of the root in search for food! Consider the powerful ramifications of roots sending out their fibres and hairs in every direction, encompassing the soil, penetrating often several feet into the ground; conceive the countless myriads of these living, plant-feeding organs, which must be in contact with the particles of soil in a proper physical condition, and we have an idea of the enormous forces which are here at work.

Admitting then, that the roots of plants have the power of extracting their food immediately from those portions of the soil which are in direct contact with their absorbent surfaces, that is, when the necessary nutritive elements

are present in suitable physical combination, I maintain that the assumption originated by Liebig, that it was only from a watery solution in the soil that mineral plant-food could be assimilated, that in order to be available it must be soluble in water—this assumption, I say, is entirely ungrounded. And yet this is the view which has been almost universally accepted by agricultural chemists. Thus in the manufacture of superphosphates of lime from mineral phosphates, at the suggestion of laws, the object was to render the neutral or insoluble phosphate, by the action of sulphuric acid, soluble in water. Thus the commercial and manurial value of phosphate manures has been estimated by the amount of phosphate of lime present which is soluble in water, that portion which has become reduced or reverted (that is, which has lost its solubility in water), and that which has remained insoluble being considered nearly if not absolutely useless as a fertilizer. Nay some have assumed such authority on the subject, that they have even caused laws to be enacted to prevent the sale of phosphate manures containing less than a certain percentage of soluble phosphate. Assuredly it is time to take up the matter in the interest of the public; for if it is true that finely-ground unvitriolated phosphate of lime is equal in manurial effect to superphosphate, why then should the farmer buy acid to perform a function for which nature has already amply provided? Why should we pay two prices for our phosphate manures, not only in manufacture for so much vitrol which we do not want, and indeed would rather be without, but also in transportation for two tons to get one tone of useful material?

I hold that the insoluble, non-crystalline mineral phosphates (such as Canadian phosphate), as found abundantly in nature, need only to be mixed in fine powder with the soil under suitable conditions. The plant, then, assisted by the action of the weather, will convert with acid from nature's own acid chambers as much of the insoluble into soluble or superphosphate as it requires.

These views have been held by the late Dr. St. Julien Ravenel, of Charleston, since shortly after the discovery of the South Carolina Phosphate deposits in 1867, but although circulated to some extent among his personal friends they did not come before the public until 1877, when the Agricultural Society of South Carolina, struck by their originality and force, appointed a committee to investigate the subject.

The special reasons which prompted the society were the impoverished condition of the low country of South Carolina after the war, the small crops which were made from exhausted land, and the necessity of home production. A series of field experiments were thus instituted under Dr. Ravenel's supervision to test the practical value of his views as applied to the production of cereals and grass, with the object of ascertaining if these crops could be grown at a moderate cost on the poor coast land of the State.

Dr. Ravenel was led to the belief that this could be accomplished by the following considerations expressed forcibly in his own words:

"1. When a sheaf of wheat weighing one hundred ounces is carefully burned, ninety-five ounces disappear; five ounces remain as ashes. The gaseous matter gone off consists of the elements of air and water; the ashes left of mineral matter existing in small quantity in all soil. Ninety-five per cent then of the material which plants are composed is superabundant, while the five per cent. of mineral matter needed is

cheaper in Charleston than anywhere on the globe. Heat and sunlight supply the force by which the germ or seed works this material into the mature plant. Our geographical position secures us an ample rainfall, equally distributed through all the months of the year; bright sunlight, a winter temperature high enough for the growth of important crops, a summer heat not too great for the full development of semi-tropical plants, secure us, in effect, two seed times and two harvests in one year.

"2. As among animals some feed on grass and others require more highly organized matter for their nourishment, so among plants some form their substance from the air, water and mineral matter of the soil directly, while others cannot do so, but live upon the remains of a vegetation which has previously flourished and decayed upon the land. For example, a sheep confined to a good pasture thrives; a dog under the same circumstances starves. The grass must be converted into matter before it can support the dog.

"Wheat will not grow upon poor land supplied merely with mineral matter, but pea-vines will, and when these have decayed upon the land wheat will flourish there. Here the leguminous* plant does for the graminaceous one what the herbivorous animal does for the carnivorous.

We have many leguminous plants, some of which grow from spring to fall, others from fall to spring. By supplying the necessary mineral matter and using those plants which grow during the summer to prepare food for small grain, and those that grow during the winter to do the same for grass, there is good reason to hope that the coast lands may be made to produce remunerative crops, and those of a kind which are sowed and reaped by the efficient labor-saving machines of the day." In order to test the system thus proposed several experimental stations were formed in the neighborhood of Charleston. They were placed under the direction of practical men and conducted with scientific accuracy, reports being made by the committee on coast lands to the Agricultural Society of South Carolina. These reports show an average yield, from a series of years, of twenty-five bushels of wheat, forty-five bushels of oats and four tons of good hay to the acre. The lands on which these results were obtained consisted of poor sandy loam, so exhausted previously that without manure they could not produce eight bushels of oats or five bushels of corn to the acre.

For those who are interested in details I subjoin the following report of results for season of 1878, and give the manner of conducting the experiments:

OATS.			WHEAT.		
No. OF ACRES.	AM'T. Bush.	PER ACRE. Bush.	No. OF ACRES.	AM'T. Bu. Lbs	PER ACRE. Bu. Lbs
(a) $3\frac{1}{2}$	130	40	(d) $\frac{1}{4}$	7 43	30 52
(b) $1\frac{3}{4}$	78 $\frac{1}{4}$	45	(e) $\frac{1}{4}$	6 27	25 48
(c) 1	60	60	(f) $\frac{1}{4}$	5 26	21 44

These six fields were planted under Dr. Ravenel's system, no other manure being used, and all treated in the same manner, except that fields c and d were planted with the drill.

* There are many members of the family of plants called legumes (leguminosae), which may be used as fallow crops, that is, by not extracting the alkalies of the soil, and only a small quantity of phosphates, they exercise no injurious influence on crops which are cultivated immediately after them. They act also as carriers of nitrogen. Such plants are beans, peas, vetch, clover, lucern, buckwheat, &c.

The following is the formula for cultivating cereals and grass as practiced at the experimental farms:

GRASS TO MAKE A MEADOW.

"1. *The kind of grass.*—The Bermuda* (as being particularly suited to that coast) is recommended. It is best to select for a meadow-land well-set in this grass, because it does not seed, and is propagated only by transplanting.

"2. *The manner of cultivating grass.*—Plough the land thoroughly in the spring or early summer, next scatter together broadcast over it two bushels of cow-peas and 500 pounds of ash element to the acre, with seed of the vetch, if the vetch is not already on the land, and harrow and roll it until it is even and smooth enough for the mower.

The peas must not be used as food for man or beast. Suffer them to die on the land in the fall; it is believed unnecessary to turn them in.† The vetch comes up in December, lives through the winter, and dies in the spring and early summer. Then the grass shoots and must be cut from time to time in the course of the summer, when ripe for the mower. The meadow is then established.

"3. *The Manner of Maintaining the Fertility of the Meadow.*—This is managed through means of the ash element and vetch. Every autumn, when the grass has died down, scatter over the meadow 500 to 1,000 pounds of ash element per acre, the quantity being determined by the weight of hay taken from the land; if under four tons, 500 pounds will be sufficient. The vetch having soded itself, as it always does, appears again spontaneously in December, and the two, ash element and the vetch, combine to fertilize the land for the crops of the following summer.

"4. Experience thus far at these farms indicates that the meadow, when so established, must not again be touched with the plow.

THE SMALL GRAINS.

"The land is to be prepared for small grain through a crop of cow peas ‡ as for grass. Having been thoroughly ploughed two bushels of peas and 500 pounds of ash element are sowed broadcast per acre, and harrowed in with a heavy harrow. If, when the peas have matured, there is time to allow them to die on the land, it is more economical, and just as well in other respects that they should. In this case plough the land and sow the grain. But if there is not time the vines must be turned in with a heavy plough and the land harrowed for the grain. The use of the drill in planting these crops is recommended. If it is intended to put the land in grain a second year, &c., &c., as soon as the crop is harvested turn the stubble under with a

two-horse plough, and repeat the process of preparation by sowing cow peas and ash element as already described.

"The peas have been sowed broadcast at these farms, but every one will sow and cultivate them in the manner experience teaches him to be the best.

"The 'ash element' mentioned above consists, as the name indicates, of the most important element of the ashes of plants, viz: lime, potash, and phosphoric acid. It is prepared simply by mixing in equal proportions, calcined marl, of the great eocene marl beds of the coast; South Carolina phosphate ground to an impalpable powder (showing under the microscope 30,000 particles to the linear inch), and alkaline salts (kainit) from the mines of Stanfurt, Germany.

These experiments have attracted the attention of many intelligent farmers in the State and elsewhere. In many instances they have been tried on a larger scale, and in every case when fairly tested, so far as I have been able to learn, with like success. Indeed, evidence goes to show, by the gradual improvement on land year by year to which the system has been applied, that the process is cumulative rather than exhaustive. Nor has it been confined only to small grain and grass crops, but has been equally successful when applied to cotton, corn, potatoes, turnips, etc.

Would it not seem worth while, then, in the face of these results, for farmers everywhere to put these principles practically to the test? These are not theories, or speculations, or laboratory experiments only; they are facts proved in the field under the most trying circumstances. I am aware that they contradict the assertions of many acknowledged authorities on agricultural chemistry. There are, however, some exceptions to the rule.

Dr. Charles Graham, professor of chemical technology, University College, London, in an exposition of his views on the use of unvitriolated phosphate of lime, published in the *North British Agriculturist*, February, 1881, writes:

"The suggestion of Liebig and Lawes that the slow-acting, half-inch bones should be submitted to the vitriolating process, whereby soluble phosphate is formed, was at one time of some value, since it gave agriculture a convenient means of distributing over the land an easily soluble substance in the place of the pieces of bone previously used, and which were slowly decomposed and dissolved, owing to the size, the gelatine, and the fatty matters. With coprolites the suggestion was readily adopted, and, as years rolled on, acid was more and more used in the preparation of phosphatic materials, until at last these indeed became rather vitriol carriers to the profit of the manure manufacturers than to the benefit of agriculture.

"Analytical chemists attached so high a value to the soluble phosphate that the factor 30 became with many the multiplier in calculating the commercial value from the centesimal composition of superphosphates. Some, indeed, went beyond this, and in time analytical chemists came to think of soluble phosphate as the only test of vitriolated phosphatic minerals, the insoluble being regarded as of little or no use. The vitriol makers had good cause to rejoice at Liebig's suggestion and its extravagant valuation by those who followed him. As chamber acid may be profitably made at £2 10s. (\$12.50) a ton, there was every inducement to saturate manure with it, and analytical chemists stimulated this abuse. Now, more than twenty years ago I wrote to the *North British Agriculturist*,

attacking the highest valuation of soluble phosphate. A manufacturer in reply attempted to controvert my arguments by allusion to the cost of his plant, and by the, to him, cogent argument that analytical chemists should be the last to attack manufacturers who gave them employment."

In another communication addressed to the *North British Agriculturist*, January, 1869, Dr. Graham explains his views as follows:

"The employment of sulphuric or hydrochloric acid with phosphate of lime, dating from the time of Liebig's and Lawes' recommendation, has led agriculturists and chemists in a great measure to ignore, firstly, the real use of the acid, and secondly, the mode in which plants take up phosphate of lime. At first it was very generally assumed that the acid phosphate in the manufactured superphosphate remained in a soluble state in the soil until absorbed by the plant. There are, however, few who now doubt that the acid superphosphate when mixed with moist soil becomes again insoluble, either from the action of lime in the soil or of the clay. Clay is the more general agent in this change.

It is, however, beyond my present purpose to consider the chemical compounds formed by this re-insolubility of superphosphates in the soil. This change is a rapid one, a few days, or at most a few weeks, sufficing to destroy the solubility (*i.e.*, in pure water) of the manure. It may be asked: How, then, account for the great benefit to agriculture which was undoubtedly experienced by the adoption of Liebig's superphosphating principles? The answer to this is simple. Before Liebig's recommendations green bones, the size varying from quarter of an inch to half an inch, were used for grass, turnips and other crops.

"Of course, in such a mechanical state the action was slow, hence it was found that by treating them with acid the action was quicker, or, in other words, that a much less quantity would suffice for a given crop. The action was chiefly a mechanical one. The sulphuric or hydrochloric acid employed acted as a grinder, hence the bones were distributed more evenly in the soil, and presented to the solvent agencies therein an enormously increased surface of action. This, setting aside for the moment the value of the gypsum formed in the superphosphate, and which, when desired as manure, may be had cheapest as gypsum, is the solution of the benefit experienced in the adoption of the superphosphating theory. The real solvent before absorption by the plant is in all cases carbonic acid water; the humic, ulmic, and other organic acids arising from the oxidation of the vegetable matter, more or less found in all soils, may or may not form solutions of phosphate of lime, and be taken up as such by the plant.

"Be this as it may, carbonic acid is the final product of the oxidation of vegetable matter, and is sufficient for explaining our present need. Limiting ourselves, therefore, to the consideration of carbonic acid water we see that the whole process may be explained in the absorption by the capillaries of the solution of the neutral phosphate in carbonic acid water, and the subsequent deposition in the cells of the plant of the phosphate and carbon, the oxygen and the water being for the most part exhaled.

"This absorption of phosphate of lime is, of course, coeval with the origin of vegetation, and therefore prior to the use of superphosphate of lime. It seems, to me, that agriculturists should now consider whether this expensive vitriol process may not be with advantage superseded by the older and simpler methods of nature."

*The Bermuda is a perennial grass, whose roots take complete possession of the soil and hold it, to the exclusion of all summer plants, even of broom-sedge. It requires, however, a very rich soil to make it grow thick and high enough to cut. Under favorable circumstances it makes two heavy crops of delicate grass during the summer, which dries easily, keeps well, and is second to none in feeding value.—Dr. R.

†To determine whether it were necessary to turn in the green vines, always a difficult and troublesome operation, some of the dried vines were washed in a filter with water, the water tested, and found to contain all the valuable constituents of the vine, showing that no loss of fertilizing material had been occasioned by the plant dying on the surface of the land, and proving the turning in which has greatly prevented the general adoption of this mode of fertilizing to be unnecessary.—Dr. R.

‡The dried vines of the cow-peas sowed with ash element were found by Dr. Ravenel to contain nitrogenous matter capable of producing 2½ per cent of ammonia, and 10 per cent of mineral matter or ash. The continuous use of the pea as a fertilizer has not proved satisfactory where a liberal supply of mineral matter has been omitted.

Dr. Graham then goes on to suggest the composting of the finely-ground mineral or bone phosphate with farm-yard manure as the cheapest carbonic acid manufactory, or where that is scarce, with turf, leaf-mould, sawdust, &c. Employed thus, or added in a ground state to a highly vegetable soil without previous preparation, he maintains that mineral or bone phosphate in a fine state of division will act as quickly as ground, boiled, or green bones, or even as superphosphate itself. In France, and more particularly in the lands of Brittany, mineral phosphates have been largely used without any previous preparation for years on poor, miserable land and yielding now large and profitable crops of cereals and roots. But in all ordinary cases he recommends composting with vegetable matter, such as dung, turf, &c., before spreading on the land.

An important consideration for the farmer, "says Dr. Graham," is that the present superphosphating method is not only unnecessary but expensive. For an equal outlay he may obtain three or four times as much phosphoric acid when purchased in the raw-ground state as in the ordinary superphosphated condition. The former would, in my opinion, do better were he to employ the money saved in the purchase of the cheaper article by expending it, not in vitrol, for which he pays so dearly in superphosphates, but in the purchase of nitrogen, and especially as regards root crops in the purchase of potash."

From the foregoing it will be seen that Dr. Graham not only advocated the use of finely-ground phosphates of lime, but suggested a method of employing them as manure as early as 1867. Experiments were made at his suggestion in Germany and on a larger scale on the borders of England and Scotland, and his views were published in foreign journals, which have been translated, or re-appeared in English agricultural journals, and in pamphlet form by Messrs. Crossman & Paulin, fertilizer manufacturers of Berwick-on-Tweed, who have done much to introduce Dr. Graham's views into England.

Many thousand tons were thus used in this way without the addition of any acid in France, Germany, England and Scotland, and have continued to be so used in spite of the efforts of grasping monopolists who avail themselves of the generally assumed high value of soluble phosphates to increase their high profits by drenching dear phosphates with cheap acids, and selling the products at the same or even at an enhanced price as a better article.

More recently, and following in Dr. Graham's footsteps, Professor Thomas Jamieson, University of Aberdeen, and chemist of the Aberdeenshire Agricultural Association, has been conducting a series of elaborate experiments to test the value of the nitrogenous matter in bare manure, and the comparative value of soluble and insoluble phosphates, mineral and animal, as a manure for turnips. Writing the 13th of May last, and enclosing a complete series of his reports from 1875 to 1881, inclusive, Mr. Jamieson remarks that during the past season his experiments have been so conclusive that his interest in the phosphate question as a question has ceased to exist.

In the last report for season, 1881, which is the unfinished proof not yet issued to the public, he reproduces for the sixth time his conclusions now final as follows:

"1. Non-crystalline phosphate of lime, ground to a floury state, applied to soil deficient in phosphate, greatly increases the turnip crop, to a less extent the cereal and grass crops, but always with equal effect, whether it be derived from animal or mineral matter.

"2. Soluble phosphate is not superior in effect to insoluble phosphate, if the latter be in a finely disaggregated form, (e.g., disaggregation effected by precipitation from solution or by grinding bones after being steamed at high pressure).

"3. Nitrogenous manures used alone have little effect on root crops (unless the soil is in the unusual state of poverty of nitrogen and wealth of available phosphate).

"Nitrogenous manures used with phosphate give a visible increase of root crop, but this increase is due mostly or entirely to excess of water in the bulbs.

"Nitrogenous manures exert a great influence on cereals, the effect of phosphate on such crops being subordinate. The increase of nitrogen in this case is not accounted for by excess of water.

"As to the relative efficiency of different forms of nitrogen, the ultimate effect of nitrogen in sulphate of ammonia, in guano and steamed bone flour is nearly identical, whether used with soluble or insoluble phosphate. Nitrate of soda, when used with soluble phosphate, is identical also with the above forms, but is of less efficacy when used with insoluble phosphate.

"4. Fine division (or perfect disaggregation) of phosphate assists the braird nearly as effectively and fully as healthily as does the simultaneous application of nitrogenous manures.

"The most economical phosphatic manure is probably non-crystalline, floury, insoluble phosphate of lime, the cheapest form being mixed with an equal quantity of the form in which the highest degree of disaggregation is reached. At present these two forms are respectively ground coprolite and steamed bone flour."

Mr. Jamieson, moreover, notices in his report the conclusions of the International Congress of the Directors of Agricultural Experimental Stations, which was held in Paris, June, 1881. Here the subject of phosphates received much attention also, and general approval of the efficacy of the undissolved forms was the result.

From the records of the Congress it appears evident that the French and German agricultural chemists are now in accord in regard to the comparative value of soluble and precipitated phosphates (i.e., those which had once been soluble but have returned to the insoluble state in fine division), which French chemists have for some time held should be on an equal footing. The French chemists in Congress, therefore, as Mr. Jamieson remarks, assented all the more readily to the doctrine of the value of raw ground phosphate of lime, as in so far as precipitated phosphate was concerned they themselves had been travelling on the same line.

The words of the declaration of the Congress are as follows:

"The Congress is of opinion that in reports of analyses the directors of stations should state the solubility of phosphates by the expressions, phosphoric acid soluble in cold citrate of ammonia, or soluble in water, and not that of 'assimilable phosphoric acid.' The Congress believing that to apply the term assimilable to the phosphate soluble in the citrate would be to class implicitly and necessarily in the category of substances not assimilable the phosphates which are evidently soluble in the soil, such as those in bone ash, guano, bone powder, farm-yard manure and fossil phosphates."

In commenting on Mr. Jamieson's experiments in Scotland, Mr. L. Grandean, commissary general of the Congress and dean of faculty of science, University of Nancy, records:

"These conclusions generally resemble, it will be seen, those which I have made from my eight years' experiments. They confirm notably the

important fact of the identity almost of soluble and of precipitated phosphate. The general conclusion of the Aberdeenshire experiments is that the tribasic phosphate in fine powder is the most economical source of phosphoric acid to the cultivator. We are then, Mr. Jamieson and myself, absolutely in accord upon this very important economical fact, that it is necessary to substitute in cultivation on the large scale the raw mineral phosphate in fine powder for the infinitely dearer superphosphates.

Among other chemists who have experimented in England may be mentioned Drs. Lawes, Provost, Cameron, Vælleker, Baldwin and Aitken, all of whom have confirmed the value of fine-ground phosphates as far as under the circumstances was to be expected, though some of these have been reluctant to abandon the old land marks. In a paper on "Co-operative Experimenting as a Means of Studying the Effects of Fertilizers and the Feeding Capacity of Plants."

Professor O. W. Atwater says: "Treating the insoluble phosphate of bone or mineral phosphate with acid to make superphosphate is expensive. Soluble phosphoric acid costs us from twelve to fifteen or more cents per pound. While we can buy it in the mineral forms for from four to six or seven cents. The general theory is that superphosphate is necessary, but still, some how or other, many of us have the feeling that, in many cases at least, the cheaper insoluble phosphates would do as well, that fine grinding might serve instead of superphosphating, and that there are many cases in which the cheap rock phosphate might replace the dearer bone manure. If, so, the saving would be immense."

Such then are the views and conclusions of some of the leading chemists and agriculturists abroad and at home, who concur in the use of fine-ground unvitriolated phosphates in place of the superphosphates. We are therefore not alone in our views on the subject, the question is not one which is confined to any one locality or soil, but is of high economical importance to agriculture in general, and may well agitate the whole world.

Now, it must not be supposed that in expounding Dr. Ravenel's views I claim for him that he was the first to suggest the use of unvitriolated phosphates, for long before the discovery of phosphates in South Carolina, and prior to Dr. Graham's experiments or even Liebig's recommendations, it is well known that bone phosphate in a powdered condition was largely used as a fertilizer. But as some misconception may arise in regard to the originality of Dr. Ravenel's suggestions I deem it necessary to state wherein he differed from Dr. Graham or any other chemist. Dr. Graham, as we have seen, gives the solution of tricalcic phosphate in carbonic acid water as the true explanation of the nourishment of plants. Dr. Ravenel believed that the acid contained in the root of the plant itself was the active agent in dissolving the plant food. These two theories of the same result are comparatively of little practical importance to the farmer.

The vital feature, however, of Dr. Ravenel's system, of which we must not lose sight, is the employment of the leguminoids along with the necessary mineral matter not only to assist in preparing the soil for future crops by furnishing the vegetable acids, but also to act as cheap carriers of nitrogen. Farm-yard manure is often scarce, but in any case when applied on a large scale the legumes effect the same end in a very much simpler and cheaper way. In like manner clover, together with "land-plaster," has been used to some extent in Virginia, and some recent experiments of Sir J. B. Lawes in England seem

to indicate a similar employment of legumes; but this systematic method of applying different legumes with all the mineral matter needed at different seasons to suit the various crops of grass, of grain, of cotton, &c., is entirely the suggestion of the late Dr. St. Julien Ravenel.

In conclusion there are some points about the economy and application of raw-ground phosphates which I wish to make clear.

In writing to me on the subject some farmers have expressed surprise at the comparative cost of soluble and fine-ground phosphates, both being sold, I believe, at very much the same price. What they ask is the economy of the one over the other? The answer is this: In the acid article the farmer gets in a ton of fertilizer only about half a ton of phosphate of lime, whereas in the raw-ground rock he gets a whole ton. At the present price of crude rock the finely-ground product is certainly dear enough, that is to say, as much or more is charged for grinding as the rock originally cost.

But as the acid in the superphosphate acts chiefly as a grinder, and a ton of superphosphate costs as much or more than a ton of ground phosphate, and yields but half the quantity of fertilizing material; there is no doubt as to the economy of the fine-ground rock.

There is no one word since the introduction of artificial fertilizers which has so misled farmers or cost them more money than the word *soluble*. For what does soluble or superphosphate mean practically to the farmer? It means that his phosphate is in such a condition that it may be washed out in the drainage waters, and that at a time when the plants most need it, viz: in the later stages of their growth it has disappeared; or it means that the possible liberation of a quantity of acid in the soil, owing to the chemical action taking place, is liable rather to exhaust than improve his land. And yet this is the article for which two prices are paid; instead of using the simpler and cheaper raw-ground phosphates which remain always stored up as in a bank in the soil for nature to draw checks on as required. But it must be understood that the finer ground the plain phosphate is, and the more uniform the powder, the more complete will be the manurial effect. Again, as I have already pointed out, the use of phosphates, or of any one element of plant food alone will not have the desired effect, unless the other necessary elements are present in sufficient quantity in the soil. Therefore, the phosphate ground to the finest possible state of division (an impalpable powder) is to be mixed with the mineral matter needed, lime and potash, and then composted with farm-yard dung or other vegetable material, or better still, and along with the legumes, which furnish also the necessary ammonia. If farmers will apply the finely-ground mineral phosphates *under these conditions*, I am convinced that they will find them efficacious as well as economical. I do not expect any one to adopt these views all at once or without a trial. I have a greater respect for the farmer's proverbial common sense; but I do expect all to try this thing for themselves. Do not ask your would-be experienced neighbor, do not ask your chemist or fertilizer dealer, but go the land and ask it the question!

And especially I urge our southern farmers to give the matter their earnest consideration. We are an agricultural people. The two essentials for plant growth are force and material. The forces are light, heat and water; the materials, lime, phosphate and potash, carbonic acid and ammonia. Our climate affords the forces in the highest degree of perfection; the materials are most of them at our very

doors. There is no reason why we should not make this one of the most blest regions on the globe, if we will only make use in a rational manner of the means with which nature has provided us.

The Value and Importance of Canadian Phosphates as a Fertilizing Agent.

(Excerpted from the Blue Books of the Hon. John Carling, Minister of Agriculture.)

The farming community of Canada, as a whole, seem to be very backward in applying artificial fertilizers to their soil, contenting themselves with the simple old time barnyard manure. With the annual exhaustion resulting from continuous yield, this is not sufficient of itself to produce the results in Canadian grain that the present system of farming might be expected to yield.

The Dominion Government has by no means neglected to bring this matter before the public, as the following extracts from its blue books show. The Minister of Agriculture, in his Report to Parliament for the year 1878, commenced to call attention to the application of phosphate as a fertilizer in the following remarks:—

“The fact of the ascertained existence of phosphate of lime in very large quantities in the Provinces of Quebec and Ontario, is of very great importance for the agricultural interests of the Dominion.”.....

“Canada is really now emerging—at least the old Provinces of the Dominion are—from the position of what may be called new-land farming, a system to a great extent dependent on the unused resources of the virgin soil, which contain the requisites for producing the cereals and grasses without resort to artificial manures. While this state of things has existed in Canada, the Old World has drawn from Peru and other countries, guano and other manures, to enable it to get returns from the soil which the old Provinces of Canada have been drawing from decayed vegetable and other deposits, everywhere found in land recently cleared of the forests. But while this virgin soil enables the new-land farmer to obtain the cereal and other crops without the expense of purchasing artificial manures for a considerable length of time, it happens in Canada, as in other countries, that the necessary properties for the production of wheat and other crops will become exhausted in the proportion that they are taken from the soil, without the return to it of the necessary fertilizers to counterbalance the exhaustion from the crop..... In many of the old parts of Canada, it has been found in places where wheat was at one time easily and profitably raised for export, the soil has become so much exhausted from cropping, that grain can now only be profitably grown by the use of artificial and other manures, in the same way as in the Old World, by a very careful system of farming and the use of such manures.

“Peruvian guano, which has been so largely used for this purpose, seems to be diminishing in quantity, and it is, therefore, fortunate that the fact of the existence of immense deposits of phosphate of lime in Canada has become known. This occurs, also, at a time when the necessity for a change in our system of agriculture has become apparent. It is not, however, the agriculturists of Canada alone who are to be benefited by the discovery which has been made.

“Already the phosphates of Canada are being used in England, Germany and the United States. English, German, and Canadian companies are engaged in the mining, and the trade bids fair to become a large and profitable one. So important, in fact, is this trade likely to be,

that it is desirable to ascertain how it can be fostered and utilized to the greatest advantage to this country.

“The percentage of purity of the ascertained large deposits of phosphate of lime is from 70 as high as 95, and this coupled with the proximity of iron pyrites appears to afford the conditions necessary for an easy and cheap manufacture of superphosphates. Such manufacture would employ the labour of our own country.”

In 1880 he again alludes to it as follows:—
“The necessity for the use of artificial manure in the production of wheat and other crops, becomes yearly more and more apparent, and especially on this continent where the virgin soil is becoming exhausted by continual cropping, and a return to it of the requisite fertilizers is absolutely necessary for profitable cultivation.

“Practical experience has shown how some of the older States, whose soil was considered inexhaustible for wheat growing, are now far behind the Western States and Manitoba, against the products of which, from virgin soil, they can only compete by heavy use of artificial and other manures.

“From the fact of a fertilizer in our midst, only requiring to be manufactured, it can readily be seen what facilities are afforded Canadian agriculturalists for its use, compared with Europeans, who have to pay the freight and other charges on the same material even in a crude state.

“I strongly call the attention of our farming community to the use of this native product, a demand for which, in a manufactured state, would soon call into existence works for the same amongst us; and such manufacture would employ the labour of our own country.”.....

“It is to be hoped that increased attention will be paid to the phosphate industries, and the results of experiments in the use of this fertilizer be noted and made public.”

In 1881 is found as follows: “The percentage of purity of native Canadian phosphate ranging from 70 to 95 per cent, affords a condition well calculated to induce our agriculturalists to use it. Even in its raw state, when reduced to a fine powder, experiments have shown that it produces valuable results. The production of wheat and other crops exhaust from the soil the necessary properties for their growth, and this can be only counterbalanced by a return to the soil of suitable fertilizers. As the virgin soil turned up by the early settler has year by year had drawn from it its requisites for producing cereals and grasses, so the time has now arrived when it will no longer produce remuneratively without resort to artificial manures. Prof. Hoffman, the analyst to the Geological Survey staff, considers that from its usual high percentage Canadian phosphate may be regarded as ‘most eligible.’..... “I would again, as in my last Report, urge the attention of our farming community to the use of this native product, a demand for which would necessarily call into existence works for its manufacture at our very doors.”

Again in 1882: “Considerable attention is being paid in various quarters to its use in the raw state pulverized, but the beneficial effects are said not to be visible during the first year. Experiments to test its appliance in this state have been made at the Agricultural College, Guelph, but the result has not been made known. From present indications considerable attention will be paid to phosphate mining and shipment during 1883.”

“There has been a tendency in some of the old provinces to cultivate continuously the cereals on rich virgin soils, and this process, whatever may be the natural wealth of the soils,

conduces to deterioration. This may be obviated by the application of artificial manure, capable of imparting recuperative properties to the soil. Experiments have shown that phosphates, especially when chemically prepared, possess these qualities in a very high degree. I would strongly urge a trial of its effects, and the comparison of the yield of grain afforded by land thus treated, with that on land without this stimulant. If an active demand were created for manufactured phosphate, its preparation would also largely aid in employing the labour of our country."

In 1883 he says: "When Canadian phosphate first came on the market, some eight years ago, practical men shook their heads at the hard and unpromising looking material. Many of the mills then in use in fertilizer-works were the buhrstones used to pulverize coprolite and other comparatively soft material. The difficulty of grinding has now been overcome, and it is no longer a source of danger to workmen, and of perplexity to manufacturers. Instead of using it as they did coprolite, it is mixed largely with other softer materials, which enables the operating chemist to first saturate the raw phosphate with sulphuric acid, and use Canadian phosphate as a drier."

"Being a more concentrated phosphate than any other in the world, it has very naturally been sought for to bring up the acid phosphate fertilizer to high percentages of phosphoric acid." "I have in previous reports, remarked that the removal by crops impoverishes the soil, and prevents it from yielding as abundantly as formerly, unless the loss is compensated by supplying phosphate fertilizers. In the districts where cattle raising is not carried on, the absence of ordinary manure must be compensated for by some artificial stimulant and experience goes to prove that for the production of cereals of every description as well as for the strengthening and renewal of worn out lands, no available fertilizer is known that can produce such beneficial results as phosphate when subjected to a chemical process, and known to the trade as super-phosphates."

"The grain exported from the port of Montreal in a single year, has been estimated to contain 2,574 tons of phosphoric acid, which implies the total exhaustion, as far as phosphates are concerned, of 75,000 acres, the renewal of which necessitates the application of some 6,000 tons of phosphates."

In 1884 he still more strongly points out the benefits to be obtained from its use—"The use of Phosphate as a fertilizer, when converted into Super-phosphate, cannot be too strongly urged on our farming population, and the advantages it offers in renewing lands worn out by perpetual cropping, in the absence of ordinary manure, the want of which is too often apparent in districts where cattle-raising is not carried on, cannot be too often impressed. In those parts of Europe where the sugar beet is largely grown—Belgium and Denmark for instance—no fertilizer has been found equal to phosphate, and the same remark might well be applied to the grain producing farms of our older provinces. The rigid inspection to which the crude material is subjected in England tends greatly to keep up the standard of our shipments, and the high percentage of Canadian phosphates will always secure for it a foremost place and an eager demand. Prof. Dawkins, comparing the phosphate obtained from various countries, states the percentage that Canada yields out of a mean of analyses, is 87.52 of tribasic phosphate of lime."

"The question has not yet been solved whether the raw material pulverized will give beneficial

results to the soil by its application, and till this fact has been ascertained, the crude phosphate will continue to be shipped to the place of manufacture. The establishment of works for its conversion into Super-phosphate, contiguous to the natural deposits, would prove of immense advantage, as the material thus converted would be far more likely to be made use of by our resident agriculturists, and transport of bulky phosphate would be resolved into shipments of a substance commanding a far higher price. The advantages obtained by foreign manufacturers would in that case be gained by Canada, and an industry might be added to those already existing which would materially add to our prosperity." "It seems to me a matter of regret that no definite action has yet been taken in regard to the conversion of crude phosphate, into superphosphate ready for use. If the manufacture of the prepared fertilizer was carried on in Canada, much larger returns would be obtained for the shipments of it made to Europe, and a considerable saving would occur in the cost of freight, as, under the present conditions, however carefully the system of collecting the crude material is carried on, there are still quantities of foreign matter associated with it, which are valueless when separated by the manufacturer. I have ascertained that the mineral from which the acid requisite for converting phosphate into superphosphate could be extracted, is present in proximity to the phosphate itself, but no steps appear to have been taken towards the manufacture of this commodity, either for home use, or for foreign export. I am, however, in hopes that with the attention the phosphate mines have received within the past year, both from members of the British Association who visited them, as well as from capitalists with a view to investment, and as the output of the crude material increases with the development of new mines, this important question of its conversion into a form ready at once for the use to which it is to be applied, will occupy the serious attention either of those at present engaged in phosphate mining, or of those who might make its manufacture a separate branch of industry."

In 1885, he again calls attention to it, and in the appendices to the Report for that year, on page 204, an instructive report on "Canadian Phosphates" in relation to agricultural use is furnished by Mr. H. B. Small, which goes very fully into the history of phosphate and contains much valuable information on the subject.

"During the past two years, owing to the attention that has been given to it, the product of Canadian mines has increased in favour with manufacturers of superphosphates. I would particularly call attention to the use of this natural product as a fertilizer to be used by our farming population. It is an established fact that wheat contains about $\frac{2}{100}$ per cent. of phosphoric acid, or about 16 pounds to each ton, and when the total shipments of wheat from this country are taken into consideration, the amount of phosphoric acid taken from Canadian soil and sent away in the wheat can easily be estimated. This loss to the soil requires the most powerful fertilizer to replace or compensate for it, and the only fertilizer known of a sufficiently high grade to effect this is phosphate of lime, when converted into superphosphate. Diversity of opinion prevails respecting the beneficial result to the soil by the application of the material in a raw pulverised state. The experience of agriculturists in the Southern States, where this fertilizer is largely used, both in the raw and prepared conditions, is largely in favor of the latter form for immediate returns, and that when the raw substance is used it should be in

combination with some other fertilizer of pronounced condition and fertility. From experiments made in the States referred to, the following deductions may be informed:—For prompt and immediate results, superphosphates, and for slow and continued results, ground phosphates are respectively valuable."

In 1886, the Minister again calls the attention of the agricultural community to the necessity of the use of fertilizers:—"When Liebig, in 1840, compelled the agricultural community to accept his views of exhaustion and restoration of the soil, and that the constant removal therefrom in harvest of the inorganic elements of plant food, notwithstanding the rotation of crops and the old system of manuring, was a robbery of the soil, which gave a present increase at the expense of the future, he founded an industry which has assumed constantly increasing proportions ever since. That industry is the manufacture of fertilizers or superphosphates, and the demand for materials with which it can be manufactured has led to a search for, and consequent working of, natural deposits in which phosphate of lime preponderates. The whole art of manuring consists in supplying the natural elements of plants in a form most favourable for absorption and assimilation, and, as ordinary manure does not always contain the most important inorganic elements required, phosphoric acid, and potash sufficient for plant use, the needs of mankind demand the employment of artificial fertilizers along with, or as a substitute for, barnyard manure."

"The attention of our agricultural community cannot be too strongly drawn to the necessity for the use of fertilizers, although the chief portion of the phosphate of lime which is produced in Canada is shipped in its crude state to Great Britain and the Continent, there to be manufactured into superphosphates, a considerable portion of which is shipped to the United States."

In 1887 he further says—"The question of using ground phosphate in the raw state is attracting considerable attention, and a series of tests will be made at the Experimental Farm during the coming season, the results of which will be made public. The manure question is one of the most important connected with agriculture, and whatever will tend to an increased production of crops must necessarily demand the attention of the agricultural community. Phosphate rock has now, to a great extent, been substituted in place of bones in the manufacture of superphosphate and commercial fertilizers, by treatment with sulphuric acid, for the purpose of rendering it soluble. Phosphoric acid, as contained in crude phosphate, has been considered insoluble in water, but water containing carbonic acid, ammonia, or common salt, has the power slowly of liberating the phosphoric acid from its basic lime, and rendering it soluble for plant food. But the slower operations of water to render the phosphoric acid available for crops, can be largely increased by mixing the pulverized material with fermented manure, or peat. This system has for several years been carried on in the United States, in connection with cotton and tobacco plants, both of which being very exhaustive to the soil, require very stimulating fertilizers to restore the growing properties essential for plant life to the land. It is to be hoped that our farming community will see the necessity of adopting some measures for keeping the land required for the use of cereals, up to its standard, by using fertilizers, and it does seem anomalous that this rich natural product at our very door, should be shipped away to the United States and Great Britain without its

value being recognized by our own farming community."

Last year, 1888, he not only still more strongly brings the matter before the public, but quotes from the "London Times" and "Morning Post," important references to the subject, made by those papers. "I continue to hope that the time is not far distant when our own farmers will see the advisability of using this fertilizer at home, which would have the effect of largely increasing this mining industry. Late advices from Great Britain show that Canadian phosphate is prominently engaging the attention of superphosphate manufacturers in that country, and the enormous deposits in this vicinity may be expected to receive thereby still more attention than has been the case in the past. I am informed that British agriculturists have been discussing of late the present position of their supplies of phosphate, that most essential element of plant food. It appears, from the inquiries of the Chemical Manure Manufacturers' Association, that the great guano beds of Peru and Chili are approaching exhaustion, and the British farmer seems timid lest the growing home demand for the phosphates of the United States and Canada, in those countries, should greatly curtail the British supply from these sources, and leave the British farmer without an adequate quantity of artificial manures at anything like reasonable prices. At this moment, therefore, special attention is being drawn to the Canadian deposits." . .

Facts like the above show that the farming community have been very strongly urged to remedy the impoverishment of the soil, which naturally takes place by continuous cropping, by the application of a fertilizer produced almost at their own doors, and the results of a want of action in this matter are only due to their own lack of interest, and not to any inaction on the part of the Government.

From the above extracts, the Canadian public will see that the Minister of Agriculture has done his share towards calling attention to the need of artificial fertilizers.

Nitrates v. Phosphates.

The frequently-quoted simile referring to the respective merits of nitrates and phosphates, as a plant food, that "the nitrate is like a glass of spirits, the phosphate like a plate of beef," is an exceedingly terse way of putting a generally acknowledged fact that, while the former is a mere stimulant, the application of phosphate adds permanently to the fertility of the soil. The simile, however, might with equal accuracy be continued as follows:—"But a combination of the two is like a substantial dinner."

The application of science to agriculture is of comparatively recent date, but, nevertheless, the progress in agricultural chemistry has wrought, as was to be expected, a corresponding advantage in the art of farming. It was soon ascertained that the artificial barrenness produced by exhaustion yields, under proper conditions, to the touch of science. Certain constituents, it was found, are indispensable for plant growth, and of these the largest quantities were continually being withdrawn. Chief among these constituents are phosphoric acid, nitrate of potash or soda, and ammonia. Most agricultural soils contain sufficient iron, magnesium, calcium, chlorine, sodium, and sulphur to last for ages, but the disproportion between the amount of the three former ingredients required by plants and the amount replaced in the soil by nature is so great that exhaustion of these elements follows as the necessary consequences of continuous cropping.

The application of science to agriculture resulted in nothing more and nothing less than the creation of a new industry, namely, the production of "commercial fertilizers."

The introduction of artificial fertilizers marks, therefore, a new epoch in the history of agriculture. Their general acceptance in common farm practice is equivalent to the introduction of a new force. They have revolutionised the mode of agriculture as thoroughly as steam and electricity have revolutionised transportation and commerce. By their judicious application a barren soil can be changed into one of great productiveness. Therefore the principal functions of a good fertilizer are to supply to the soil the three elements of plant-food usually wanting in poor or exhausted lands, viz., phosphoric acid, ammonia, and nitrate of potash or soda.

The application of scientifically prepared concentrated plant-food to the soil forms a means of estimating the progress which a country is making in the domain of agriculture. The marvellous ease and rapidity with which France paid off the enormous war indemnity of five milliards of francs has justly taken the world by surprise. Yet to a great extent it was due only to the wealth Frenchmen knew how to derive from the land they live on by a generous and intelligent method of farming, and to nothing else can this be ascribed but a practical recognition of the value of artificial manure.

Is it not strange, therefore, in the year 1889, when it has been clearly and repeatedly proved by all the leading scientists of the day, as well as by practical demonstration, that each and all of the three elements enumerated above are requisite and necessary to form the basis of a satisfactory and practical fertilizer, that men of intelligence can be found antagonistically debating the respective merits of phosphoric acid, as represented by the general term of "phosphates," and nitrates of soda and potash, usually designated "nitrates"? This is clearly attributable, however, not to a lack of knowledge of the scientific facts as they exist, but because of the different financial interest involved in the two industries, thereby causing an undue advocacy of the particular chemical ingredient in which the several parties have embarked their capital.

The time is rapidly approaching when such a state of things must end; already those most largely interested in the nitrate industry have accepted the teachings of science in regard to this question of superiority or inferiority of the respective elements, and—appreciating the certainty of an almost universal demand in the future for a concentrated fertilizer containing all the beneficial qualities to be derived from a judicious combination of phosphoric acid and nitrate of potash—are alive to the necessity of securing a substantial interest in the comparatively limited supply of the crude phosphate rock.

The average farmer's knowledge of plant, physiology, and agricultural chemistry is, as a rule, of a very limited nature. He is not able to determine for himself what are, or what are not, those essential elements of food plants which he desires to procure for his land; but he is rapidly becoming educated up to a proper understanding of the various elements, and their relative value to the soil.

The literature published by the Royal Agricultural Society of England and the Bath and West of England Society is having a very beneficial effect in this direction, and the statistics and results of experiments therein published have in the past, and will still more in the future, clearly demonstrate that the very best results are to be derived, not from the use of nitrates or superphosphates alone, but by an

intelligent use of the two in combination.

As evidence of this, Mr. J. E. Knowles, the chairman of the Experimental Committee of the Bath and West of England Agricultural Society (1888-89) states in his report that the results of twenty-four experiments in relation to wheat-growing showed "that nitrate of soda and sulphate of ammonia, when combined with superphosphate, have each given a larger produce both in corn and straw than either used alone." In the same publication the same satisfactory results were noted in reference to the oat crop. Experiments were made on $\frac{1}{2}$ -acre plots with the following results:—"The unmanured plots produced at the rate of 21 bushels per acre. By spending £1 1s. an acre in nitrate of soda (70 lbs.) and superphosphates (168 lbs.) the produce of grain was exactly doubled, and there was an increase of straw of 864 lbs., this increase in corn and straw being equal in money value to 2l. 10s., or a clear gain, after deducting cost of manure, say, 30s. per acre."

"In the plots where sulphate of ammonia alone and nitrate of soda alone were used there was a small gain of about 6s. per acre."

Similar experiments on "grass" resulted as follows:—Umanured, 4 cwt. 1 qr. per acre of hay; sulphate of ammonia, 5 cwt. 2 qrs. of hay; nitrate of soda, 5 cwt. 1 qr. 7 lbs. hay; nitrate of soda and superphosphates combined, 6 cwt. hay.

No clearer proof can be required to demonstrate beyond a doubt the unquestionable advantage of this combination, and it will be unnecessary, therefore, to trouble the reader with detailed results of the numerous other trials made.

That both the nitrate and phosphate industries have reached gigantic proportions, notwithstanding unreasonable opposition, may be gleaned from the following figures:—

	Tons.
Nitrates used annually in the United Kingdom and Continent	600,000
Nitrates used in United States (about)	90,000
Phosphates imported into United Kingdom alone (1887)	283,415
Superphosphates and fertilizers mainly based on phosphates, used in the United States (1886)	1,006,631
Of this quantity 616,631 tons were used in the Southern States in the cotton districts.	

It is difficult to estimate to what proportions this business may grow when a loyal combination is once established between the two interests, which, as we have pointed out above, must be the inevitable and speedy result of the march of progress and intelligent agricultural enterprise.

The question then arises—and it is a question which has given great concern to the manufacturers of fertilizers both in Europe and America during the past year—Where are we to look for our future supplies of crude phosphate rock which the satisfaction of this ever-increasing demand for plant-food necessitates? That the question is one of great moment for the consideration of manufacturers is evidenced by the serious anxiety evinced on this point by Mr. Herman Voss—himself the manager of one of the largest fertilizer manufacturing companies in the world—in his admirable paper read before the Chemical Manures Manufacturers' Association on 10th December, 1888. He therein stated:—"The consumption of phosphatic manures, partly owing to the use of large quantities of nitrate of soda and ammoniacal manures, is rapidly increasing all over the world, and our supply is at present dependent upon so few sources that I consider it necessary and advisable to change our mode of selling superphosphate in such a way that we could also draw

from other sources which would strengthen our hands as manufacturers."

It will be noted that Mr. Voss not only expresses anxiety as to the present limited sources of supply of the crude phosphate, but strongly emphasises the fact we have demonstrated above, that any increased use of nitrate of soda, as a matter of course, will increase comparatively the demand for phosphatic manures.

The present imports of crude phosphate rock into Great Britain, as stated by Mr. Voss, are derived from the following sources (1887):—

	Tons.
United States.....	165,275
Canada.....	19,194
Dutch West Indies.....	9,505
British West Indies.....	6,451
Spain and Portugal.....	15,612
Belgium.....	45,322
Holland.....	4,778
France.....	11,140
Australia.....	350
Hayti.....	3,044
Brazil.....	1,200
Other countries.....	1,544
Total.....	283,415

From these figures it will be seen that to supply the requirements of Great Britain alone for the next ten years, provided the demand does not increase, will require an output of about 2,834,150 tons, and it is but reasonable to assume that long before the expiration of that time many of the older sources of supply, from which there has been a continuous drain for many years past, will be completely exhausted. On the other hand, it will be noted that the Canadian supply up to the present has only amounted to about 8 per cent. of the British consumption, notwithstanding the well-established fact that the phosphate deposits in the Dominion cover such an enormous area as to warrant the assumption that in the near future Canada will take a foremost place in the world's supply of this invaluable mineral.

It will be noticed that the largest producing countries at the present time are the United States and Belgium. A reference to Mr. Voss's admirable paper shows that the average percentage of phosphate of lime in the Belgian product is not more than 50 per cent., while that of the United States contains about 60 per cent. The Canadian mineral, as imported into Great Britain averages, however, from 80 to 85 per cent. of phosphate of lime, and may at once be set down as one of the highest grades of phosphate rock the world produces.

When we take into consideration that, in order to produce a really high-grade phosphatic manure compound (for which intelligent agriculturists are year by year becoming more exacting in their demands), it is a necessity that manufacturers should procure a correspondingly higher grade of the raw material—and, if proof of this is necessary, it is to be found in the fact that makers are willing to pay a much higher price per unit of phosphate of lime for the richer minerals than they are for that of poorer quality; thus, for example, while a manufacturer is paying, say, 7d. per unit for a 50 per cent. phosphate, or 29s. 2d. per ton and 9d. per unit for one of 60 per cent., or 45s. per ton, he is willing to pay about 1s. per unit for the higher-grade Canadian, or 4l. per ton for an 80 per cent. grade, and 4l. 5s. for one of 85 per cent.—it must readily be seen that the Canadian miner must always be in a position to produce his material at a decided advantage over any of his foreign rivals.

The question then naturally arises, if this be the case, how is it that the present output is so limited?

The reply is to be found in Mr. Voss's remarks under the head of "Canadian Phosphates," as follows:—

The Canadian mines commenced to be worked some ten years ago, and the output now amounts to about 25,000 tons per annum. Our imports from Canada were:—

Years.	Tons.
1881.....	8,187
1882.....	16,531
1883.....	15,716
1884.....	21,484
1885.....	18,069
1886.....	19,194

So that it will be seen that in six years the output has increased about 250 per cent.

Capital is the agent most required in Canada to build up and develop her mining industries. With it much more could be accomplished; without it Canadians are unable to avail themselves to the full extent of their rich phosphate territory.

Canada offers to the British capitalist a large and profitable field for investment in her phosphate properties. As the great and vital question of the future supplies of fertilizing materials becomes more widely discussed capital will assuredly flow into Canada for the purpose of developing this profitable industry; but it behoves every Canadian, every man interested in the great future of this business, to see that the interests of the British investor are safeguarded by countenancing only those mining schemes which can bear honest investigation, and that will provide a fair and reasonable expectation of returning to those who invest their money in these properties a good and permanent interest on their capital. Otherwise, notwithstanding the glorious future opening out for those at present engaged in the business, capital will seek investment elsewhere, and the advancement of the colony, as well as its mining industries, will be permanently impeded.

Phosphate of lime (apatite) was first discovered in Burgess, Ontario, in 1847. In 1860 the first shipment of the mineral was made, amounting to about 100 tons.

The earliest discovery of apatite in the County of Ottawa was made in 1829 by Lient. Ingall, of the 15th Regiment, while engaged in certain geological explorations. Mining operations were not engaged in until 1873.

The entire phosphate beds of South Carolina, so far as discovered and defined, have been estimated to cover an area of 240,000 acres. It was not known that the rock possessed any commercial value until the year 1865.

In those parts of Europe where the sugar beet is largely grown—Belgium and Denmark, for instance—no fertilizer has been found equal to phosphate, and the same remark might well be applied to the grain producing farms of our older provinces. The rigid inspection to which the crude material is subject in England tends greatly to keep up the standard of our shipments, and the high percentage of Canadian phosphate will always secure for it a foremost place and an eager demand. Prof. Dawkins, comparing the phosphate obtained from various countries, states the percentage that Canada yields, out of a mean analysis, is 87.52 of tri-bassic phosphate of lime.

Our Fertilizer Trade.

As has been pointed out in these columns, farms are constantly being abandoned in Ontario and Quebec, and families are compelled to emigrate to a life of comparative hardship for the sake of newer soils when a knowledge of the means of enriching the old lands, and where these may be obtained, would preserve their homes in comfort and affluence. It is no exaggeration to say that the agriculture of the future depends upon the growth and development of this industry. Already works have been established in various parts of Canada.

The largest now in operation is owned by Messrs. G. H. Nichols & Co., the well known manufacturing chemists of New York. Some years ago, they purchased what are known as the Capelton mines, situate at Capelton, Province of Quebec, and have worked them on a very extensive scale up to the present time. The ores mined, being a sulphuret of copper and iron, were shipped to Laurel Hill Chemical Works, New Jersey (also owned by Messrs. G. H. Nichols & Co.), where they were treated and prepared for market. About two years ago, they decided to erect a large chemical manufacturing plant at Capelton, contiguous to their mines, for making sulphuric acid and other chemicals, also superphosphates. In the manufacture of the latter the apatites from the Ottawa Valley are largely used, being regarded by this firm (who are most competent judges) as the finest quality known for the manufacture of mineral manures.

Messrs. G. H. Nichols & Co., with their various works, manufacture more sulphuric acid than any other concern on this side of the Atlantic Ocean; they have everything known to modern science (together with many things not generally known) wherewith to manufacture, not only economically, but of great purity.

Their works at Capelton are well and conveniently located on the Possumpsic Division of the Boston and Maine Railroad, and at only a very short distance from the Canadian Pacific and Grand Trunk Railways, thus making them accessible to every part of the Dominion of Canada. In answer to our enquiries, the firm writes:

"This spring we decided to commence the manufacture of chemical fertilizers for Canadian farmers, feeling that up to that time they had been at a great disadvantage as compared with their American neighbors, in that fertilizers furnished them had not only been in many instances improperly made, but almost universally at much too high a price to enable them to use them advantageously. We constructed a small experimental works, manufacturing the grades referred to in our advertisement, and while the outlet has not been as large as we could have desired, we have found, on the whole, the farmers to take hold of it with a good deal of intelligence. We have been sufficiently encouraged to believe that our policy of high grade goods at the lowest possible prices was correct, so that we are now preparing to erect in time for the winter trade a large and complete fertilizer works at Capelton, in which we expect to be able to manufacture fertilizers to the extent of several thousand tons per annum by the most approved modern machinery. It is our expectation to distribute this fertilizer through agents in various parts of the country, who will be controlled from our central office, so that there will be no danger of their overcharging farmers. The prices mentioned in our advertisement are what we expect the farmers to pay, any commission for agents being paid by us. If the trade warrants, we are prepared to extend the fertilizer department to any necessary degree, so that Canadian farmers may be certain that they may get all of the fertilizer they want at the lowest possible margin of profit. We simply need their co-operation to make the enterprise a success both for ourselves and for them."

The next manufactory of importance is located at Smith's Falls, Ontario. The works are much older than those above referred to, but not as large. Mr. R. J. Brodie, a graduate of McGill College, has charge of these works. Mr.

**DEPARTMENT**

OF

Inland Revenue.**AN ACT RESPECTING AGRICULTURAL FERTILIZERS.**

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALI,
Commissioner.

January, 1889.

**NOTICE**

Is hereby given that all communications in respect to matters affecting the Department of Indian Affairs should be addressed to the Honorable E. Dewdney as Superintendent General of Indian Affairs, and not as Minister of the Interior, or to the undersigned. All Officers of the Department should address their official letters to the undersigned.

L. VANKOUGHNET,
Deputy Superintendent-General
of Indian Affairs.

Department of Indian Affairs, }
Ottawa, 11th May, 1889. }

**Intercolonial Railway**
OF CANADA.

The direct route between the West and all points on the St. Lawrence and Baie des Chaleur, Province of Quebec; also for New Brunswick, Nova Scotia, Prince Edward, Cape Breton and the Magdalene Islands, Newfoundland and St. Pierre.

EXPRESS TRAINS leave Montreal and Halifax daily (Sunday excepted) and run through without change between these points in 30 hours.

The Through Express Train cars of the Intercolonial Railway are brilliantly lighted by electricity and heated by steam from the locomotive.

New and Elegant Buffet Sleeping and Day Cars are run on all through Express Trains.

The popular Summer Sea Bathing and Fishing Resorts of Canada are along the Intercolonial, or are reached by that route.

CANADIAN EUROPEAN MAIL
AND PASSENGER ROUTE.

Passengers for Great Britain or the Continent by leaving Montreal on Thursday morning will join outward Mail Steamer at Rimouski the same evening.

The attention of shippers is directed to the superior facilities offered by this route for the transport of flour and general merchandise intended for the Eastern Provinces and Newfoundland; also for shipments of grain and produce intended for the European market.

Tickets may be obtained and all information about the route, also Freight and Passenger rates, on application to

G. W. ROBINSON,
Eastern Freight and Passenger Agent,
137½ St. James St., MONTREAL.

E. KING,
27 Sparks Street,
OTTAWA.

D. POTTINGER,
Chief Superintendent.

Pittaway & Jarvis'**117****Sparks St.**

Brodie states that he makes the sulphuric acid from the pure sulphur. He gets rid of the hydro-fluoric acid gas—which is produced by the action of the sulphur acid on the apatite—by a simple arrangement of wooden chimnies, thus solving a difficulty which has embarrassed many persons in their efforts to use Canadian phosphates. He makes a "complete fertilizer," that is, a mixture of the three principal ingredients of plant food, namely, phosphate, potash and ammonia. The demand is growing in a very encouraging manner, for when a farmer tries it once, he generally comes back for more. Mr. Brodie says he could sell many thousand tons during the coming year if he could make it, but the factory is small and the facilities not very great.

The advantages to the agricultural community in having such important enterprises as these is simply incalculable, for the farmer knows this important fact better than anyone—that the soils of the older settled provinces have become impoverished by years of cropping without replenishment, and districts that once yielded great stores of grain now only afford the scantiest pasturage or produce.

There is evidently a large and extending field in the Dominion of Canada for both the manufacture and use of fertilizers, which, if properly and judiciously nurtured, must tend to both profit and usefulness. As a well-known writer has said, "Our agricultural future must depend upon supplies of plant-food brought from sources outside the farm, and prepared for the farmer's use by those who make it their business to do so, and who must, in order to succeed, bring to it not only a large capital, but likewise science as a handmaid, skill and talent as absolute requisites. The progress of this industry measures the true progress of Canada, and promises results which it is impossible to foresee at this day. It opens up a wide vista of changes and improvements. It heralds the awakening of agricultural thought, and has partly awakened it. And with thinking comes improvement, comes better tillage of the soil, comes better stock, comes larger crops, better profits, and lastly, a higher moral and intellectual standard."

Exports of Canadian Phosphate.

The exports of Canadian phosphate from 1877 to 1888, as per official returns, may be stated to have been as follows:—

Year.	Tons.	Est'd value.
1877	2,823	\$ 47,084
1878	10,743	208,109
1879	8,446	122,035
1880	13,060	190,086
1881	11,968	218,456
1882	17,153	338,357
1883	19,716	427,668
1884	21,709	424,240
1885	28,969	496,293
1886	20,440	343,007
1887	23,690	319,815
1888	22,485	242,285

The exports for 1889 promise to exceed those of the last two years.

Parties having developed or undeveloped mineral lands for sale will find the REVIEW an admirable medium for bringing them before the notice of CAPITALISTS and INVESTORS in GREAT BRITAIN and the UNITED STATES.

On the Occurrence of Phosphates in Nature.*

D. G. M. Dawson, F. R. S., R. S. M. N.

In proposing to review, in so short a paper as this must necessarily be, a subject so extensive as that indicated by the title, a difficult task has been undertaken, and I cannot hope to do more than touch upon its main points.

In the first place it may be proper to enquire why phosphate materials are now so much sought for as fertilizers.

It has been said laconically that "Phosphorus is life," but this, like most bold generalizations, is but a partial, and even a misleading statement of the fact. Certain it is, however, that this element, variously combined, is present in all living tissues, whether vegetable or animal, and though in small quantity only, is absolutely essential to these tissues, and, therefore, to the manifestation of life. Animals, depending ultimately for their subsistence on plants, derive from these their supplies of phosphorus, together with the other substances necessary for their nutrition.

Unlike the animal, the plant is capable of living, ultimately, on inorganic substances, and while deriving a large part of its food from the air, is absolutely dependent on the soil for those incombustible constituents which, when the plant is burnt, remain as ash. Without these the growth of the plant is impossible, and it is therefore necessary to ensure a sufficient supply of them in the soil. Phosphorus, in a state of combination, is one of these, and that to which I wish particularly to refer.

In following this substance from the soil to the plant, from the plant to the animal, and from the animal again to the plant, we find a system of circulation which, under certain conditions might go on indefinitely. In a state of nature, this cycle is generally complete, but it is interfered with and broken by the present organization of humanity, and more particularly by those arrangements which have resulted in the massing of population in large towns.

In these it is found necessary to remove the effete and excrementitious matters by a system of sewage, which results in draining the phosphates and other substances valuable from an agricultural point of view, into the sea, where they may be considered as absolutely lost. Victor Hugo, in a well-known passage, contrasts the wealth to be seen rolling through the streets of Paris to that which is silently but steadily flowing away by the sewers beneath, which he maintains is greater. Be this as it may, in this particular case there is a continuous process on a large scale in action, by which the land is deprived of its phosphates, and particularly in a country like this, which exports great quantities of food material, with their contained phosphates, to be consumed abroad.

Some years ago (1869) Mr. Gordon Brown calculated the amount of phosphorus actually contained in grains annually shipped from the port of Montreal, estimating it for this purpose in the form of phosphoric acid. Wheat contains about $\frac{1}{10}$ (eight tenths) per cent. of phosphoric acid, or about 16 pounds to each ton, and as the total shipments of wheat amounted to 292,534 tons, the quantity of phosphoric acid sent away in it equalled 2,340 tons. Taking the average quantity of this substance contained in good soils, he found that this meant the total exhaustion to a depth of 12 inches, in so far as phosphates are concerned, of 70,320 acres, and would require the use of 5,850 tons of apatite

of good quality as manure to maintain the fertility of the fields. Adding to this the amount of phosphoric acid contained in other grains exported, he found the total loss in the year to be 2,574 tons of phosphoric acid, representing a value of over \$500,000.

With such statistics in evidence it will not be necessary to enlarge further on the necessity of discovering a source of supply of phosphates for our fields, and for this we must have recourse to some specially concentrated natural deposits. What, therefore, is the nature of these, how have they been found, and where do they occur?

In answering these questions, it must be remembered that soils have been produced by the decay and disintegration of rocks, and have derived their contained phosphates from the rocky crust of the earth.

Good soils contain say about $\frac{2}{10}$ (two-tenths) per cent. of phosphoric acid, and on analyzing rocks chemically or microscopically we find phosphates—generally calcic phosphate—present in them in similar small proportions. In some crystalline rocks we find apatite, or crystalline calcic phosphate so abundant that it can easily be recognized under the microscope. It is needless to say, however, that the percentage of phosphate present in ordinary rock masses is quite too small to suit them to be used as fertilizers for exhausted soils. We must have recourse to some richer sources of supply, and the concentration of phosphates in nature is generally found to have been brought about by organic agency. Of these concentrated deposits of phosphatic matter we may first glance at those known as Guanos. These are essentially composed of excrements of sea birds. Extensive accumulations of this character can occur only in dry climates, for though formed wherever sea birds congregate in great numbers, the rain fall is usually sufficient to remove them before they reach important dimensions. Guanos are naturally divided into two classes, though between the extremes of these there are many intermediate varieties.

These classes have been named respectively nitrogenous and phosphatic. Those of the first class occur in exceptionally dry climates, such as are found on the coast and adjacent islands of Peru, Bolivia and Chili, where rain seldom or never falls. In these the nitrogenous constituents of the organic matter—converted by decomposition into ammonia salts—remain as a part of the mass. In phosphate guanos, on the contrary, the rainfall has been sufficient to remove the whole or nearly the whole of the very soluble ammonia salts, while not enough to wash away the phosphatic material. Guanos of this class are of common occurrence in the West Indian Islands, and in some of these in which the subjacent coral rock is penetrated by caverns, only such part of the phosphatic accumulations are preserved as have been washed into these subterranean hollows through fissures, or have penetrated to them in solution through the porous coral rock.

In the Ardennes region of the south of France, phosphatic deposits occur which, in my opinion, are very similar in origin to those just alluded to. These, however, are very much older, and, in fact, include fossils of Tertiary age, and, so far as known, none of modern forms. They fill irregular cavernous fissures which traverse the surface of plateaus composed of Jurassic limestone, and it would appear that the higher parts of these plateaus have at one time formed an archipelago of bird-frequented islands in a Tertiary sea. The phosphate or phosphorite from these deposits is known commercially as

* Read before the Field Naturalists' Club, Ottawa

Bordeaux phosphate—from its place of shipment, —and though very irregular in its occurrence, is largely worked and exported.

Phosphatic deposits like these, however, directly referable to surface accumulations by sea-birds, are, as a rule, quite modern. With rare local exceptions, any which may have been found in the earlier geological periods have been washed away and lost; the very process of submersion, necessary as a preliminary step to the preservation by burial in the strata, causing their dissipation. Most of the truly fossil phosphates found in connection with the older rocks have been found in a quite different manner. To understand this we may examine first such modern deposits as the "mussel muds" of Prince Edward Island. These are accumulations produced in shallow tidal estuaries where great numbers of molluscs and other marine organisms are going to decay, so rich in phosphates and organic matters as to be of great value locally as a manure. Deposits more or less closely resembling these are found in many parts of the modern sea bottom and along the coast, and where just such deposits have been buried deeply, and included in some of the older formations, they produce what are known as "coprolite beds." This term, however, it must be explained, is in general very loosely applied. It should be restricted to the fossil excrements of various animals, which are occasionally found in the rocks, and often in such beds as those just referred to, but seldom even then constitute more than a small part of the phosphatic matter, most of which usually occurs as concretions or nodules. These have resulted from that slow process of drawing together of like particles in the mass, which is usually designated concretionary action, but is not in all cases fully understood. A fragment of shell or bone, or a tooth frequently serves as the nucleus of such a concretion, and when the material is abundant such concretions frequently coalesce and form almost continuous layers. The so-called *coprolite beds* of Cambridgeshire, Bedfordshire and other localities in England, and those of Carolina, in the Southern States are of this nature.

The last-named deposit dates no farther back than the Tertiary, and consists of a layer, usually from six to fifteen inches in thickness charged with nodules of calcic phosphate and containing also bones, teeth and shells, the pores of which have been more or less completely filled with the same material. This deposit lies at no great depth below the surface, and is still nearly horizontal. In some places it is below high-water mark, and large quantities of the phosphatic nodules are obtained by dredging in some of the estuaries and channels which penetrate the low alluvial country. Where the nodule-bed occurs above the sea-level it is worked by a system of trenching, the finer material being washed away on gratings, and the nodules then dried—generally by artificial heat—before being sent to the mill.

A long way farther back in time are the "Coprolite" beds of the south of England, which date in fact from the Cretaceous period. Where this deposit occurs at an inconsiderable depth below the surface, it is worked by a system of trenching similar to that employed in Carolina, the soil being carefully put to one side and subsequently restored, and the land again brought under tillage. As the deposits are thin it does not pay to follow them to any great depth, but some years ago the annual production was as much as 25,000 tons.

These can be considered only as instances of the mode of occurrence of phosphatic materials

in the geological series. Deposits more or less closely analogous, to those described and sufficiently rich to work are found in a number of other localities, which we have not now time to consider. There is reason to believe that phosphatic or "coprolitic" nodular deposits have been found wherever the local conditions were favourable and large quantities of animal matter were in process of accumulation and decay, throughout the entire geological series. Going a great way back in geological history, we find instances of this in Canada in parts of the Chazy subdivision of the Silurian, in the Graptolitic shales of the Quebec group, and even in the Cambrian rocks of St. John. It is true that none of these deposits are of importance from an economic point of view, for instances of workable deposits in these palæozoic rocks we must turn elsewhere.

They are merely mentioned here for the purpose of connecting the occurrence of naturally concentrated phosphatic materials as found in the newer rocks, with the deposits of the same material found in the oldest known rocks—those of the Laurentian period.

In the Laurentian rocks—which are those characterizing the great country to the north of the Ottawa, and elsewhere very largely developed in Canada—we have a great volume of sediments, deposited in an ocean of vast antiquity, the earliest in fact of which we find any traces. These sediments which, no doubt, originally resembled in their main features those of later ages, have since been so completely metamorphosed that their materials have entered into new combinations among themselves and become entirely crystalline. While, therefore, still consisting of the materials originally deposited, they resemble them as little in appearance as do the crude ingredients of glass the finished product. There can, however, be no doubt of the original sedimentary origin of these Laurentian rocks and the change from muds and sands—and I would also include contemporaneous volcanic materials—to wholly crystalline rocks such as these, is seen in less metamorphosed formations in various parts of the earth's crust, and has been traced in all its stages. If, therefore, ordinary limestones were originally present in these old rocks, we would expect them now to have assumed a wholly crystalline character, and to appear as marbles. Contained beds of a peaty or coaly nature might be expected to pass into crystalline carbon or graphite, and phosphatic nodular or coprolitic layers could appear only as crystalline calcic phosphate or apatite. As a matter of fact we find all three of these substances in the Laurentian, and though the proof may not be absolute that their origin and appearance was at first the same as that of analogous materials in the newer rocks, the evidence is all in that direction. The main facts in regard to the mode of occurrence of these deposits of apatite in Canada, so far as our knowledge goes, must be very briefly presented. Some of the beds in the Laurentian series are found to be comparatively rich in apatite, crystals and crystalline masses of this mineral being scattered through them. This is the case in some of the marbles, occasionally in the iron ores, and also particularly in connection with the pyroxenic rocks. In addition to these in which the apatite may be considered as generally distributed, certain layers, apparently of the character of beds, occur, consisting of nearly pure apatite, or containing so large a proportion of the minerals as to pay for working. Still further, we find distinct veins and fissures which have been filled with apatite by processes

of segregation in which the mineral is found either nearly pure, or more frequently, mingled with crystals of other substances.

Though the exportation of these Canadian deposits may, I believe, be considered as still in its infancy, it has already assumed considerable proportions. Quoting from an interesting paper read a few days ago by Dr. Sterry Hunt, before the American Institute of Mining Engineers, we find that the amount shipped from Montreal, in 1883, was 17,840 tons (see quantities exported in 1888 as quoted in another portion of this issue), of which a portion was delivered in Hamburg and Stockholm, but the greater part went to British ports. Of this amount, 15,000 were from Quebec, the remainder from Ontario. It is estimated, according to Dr. Hunt, that the shipments during the present year will amount to 24,000 tons.

Besides the very widespread distribution of these apatite deposits and their great economic importance, one of the most striking facts so far developed is their great irregularity. Taking into consideration the extremely disturbed character of the Laurentian rocks, this is easily understood. Layers and veins which may, before the great folding and kneading together of these rocks, have possessed considerable regularity and uniformity, have been, as a consequence of the excessive disturbance folded and dislocated in every sense, leading to the production of large pockets and irregular masses of apatite which may now be connected only by narrow and twisted seams, or may occupy what appear to be completely isolated positions.

This being the case, it may be asked, can a Geological Survey do anything to aid in the discovery of apatite and the development of this mining industry? Fortunately we are not quite without a clue in the matter. It has already been discovered (largely by Mr. Vernor's work) that certain broad zones of the Laurentian series (in part already traced out and mapped), contain most of the workable deposits of apatite, while extensive intervening belts of country show comparatively little apatite and offer little encouragement to the miner. These zones are pretty clearly recognizable by their composition and character, and though much has already been done in the matter of defining them, much more yet remains to do. They can, it would appear, be mapped down with a degree of certainty, nearly as great as regions capable of yielding good lumber, or lands suitable for farming can be defined by explorations with these particular ends in view. The further question involved in the utilization and working of special local deposits is also one requiring sagacity and special knowledge, but cannot be considered as within the province of a public survey. Like the enquiry as to how many feet of sawn lumber a given tree will afford, or how best to lay out a certain plot of a couple of hundred acres for farming purposes, this remains to be determined by the person who wishes to utilize these for his own pecuniary benefit.

Barnyard Manure.

Mr. Thomas Macfarlane, F.R.C.S., Dominion Analyst, again calls attention to the large amount of money which farmers pay for the ammonia in fertilizers, which might be saved if sufficient care was taken to preserve that contained in barnyard manure. Nearly the whole of the nitrogen in the fodder fed to farm stock is to be found in the excrements of the animals, and one-half of it is contained in the urine. It is further the fact that 95 per cent. of the

potash contained in the food of oxen and sheep may be recovered by carefully saving the liquid manure only. To secure the nitrogen, or ammonia, and the potash, the means are very simple. The dung from the different animals should be brought together and kept under cover at a lower level than the stable floor, so that the liquid manure may flow upon, over and down through it. In this way all the different sorts and both parts of the manure are properly blended, the solid part and the bedding kept moist, and none of the urine escapes. It is further necessary to strew the stable floor, below and behind the animals, with 2 lbs. per 1,000 lbs. live weight, daily, of ground plaster or sulphate of lime, which has the effect of retaining the ammonia resulting from the decomposition of the liquid, and the fermentation of the solid manure. It has recently been proposed to obtain these results by the use of superphosphates in place of ground plaster, and experiments by Heiden, Dietzell and others in that direction have been entirely successful. Dietzell mentions that 1½ lbs. of phosphoric acid only are required for the treatment of 1,000 lbs. of stable manure. The use of "plain superphosphate" in this way must result in the production of a manure of every excellent quality.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Owen Sound Work," will be received until Wednesday, the 18th day of September next inclusively, for works for the improvement of the Harbour of Owen Sound, Grey County, Ontario, according to plans and a specification to be seen at the office of the Town Clerk, Owen Sound, and at the Department of Public Works, Ottawa.

Tenders will not be considered unless made on the form supplied and signed with the actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, for the sum of three thousand dollars (\$3,000) must accompany each tender. This cheque will be forfeited if the party decline the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBIEL,
Secretary.

Department of Public Works,
Ottawa, 3rd Sept., 1889.

MANUFACTURERS OF

The "Field-Stirling" Patent High
Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel
and wrought iron exclusively. No cast-iron is employed. It is
simple in construction, has a rapid, well-defined circulation, and a
large cool mud-drum, where all impurities are collected to be blown
off. All parts of the Boiler are readily accessible for the closest inspection.
It has great excess of strength and is not liable to be
strained by unequal expansion. The water space is divided into
sections so arranged that NO EXPLOSION IS POSSIBLE.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations including bar, dry bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

A. S. HARDY,

Commissioner

Department of Crown Lands, Toronto.

The Canada Co.

Will issue Licences to Prospect or to work Minerals on any of their Mining Lands and Mineral Reservations,

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter
with original bores of 3 and 3½ inches,
bushings to be used for intermediate sizes;
larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.
22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to THE DODGE WOOD SPLIT PULLEY CO., TORONTO.

Fire-Bricks of Clay and Asbestos.—

A process has been patented in Germany for making fire-bricks by compressing in moulds an intimate mixture of 75 per cent. of asbestos and 25 per cent. of plastic refractory clay.

Rock Drills.—In a paper read by the Ritter von Rziha before the Austrian Society of Engineers and Architects, the various kinds of rock-drills are discussed. The author gives a detailed list of treatises in which descriptions of the various kinds of rock-drills have appeared. A number of the best known percussion machines are mentioned by the author, who observes that in Austria the Schram and the Ferroux drills are best known, whilst in Germany those of Frolich, Meyer, Jagar, and Schram are most frequently employed. The only important type of drills other than percussion ones is that of Brandt, which is just as frequently in use in Europe as is the percussion type, and hitherto both have been employed with almost equal success. In the Mansfeld district, both Brandt and Frolich drills have been employed for similar work, and for an equal amount of work done the cost has been about the same in both cases. The Brandt drills are preferable in cases where much water is met with, such as in sinking deep shafts and in cases where less power is available, since the power required for Brandt drills is only about 4-7 of that required for the Frolich percussion drill. Percussion drills are the most useful in long tunnels up to about 10,000 feet in length, where the compressed air escaping from the drill produces a sufficient ventilation. There are, the author states, four firms in Germany that undertake the driving of tunnels by rock-drills. They guarantee a progress of from 10 ft. to 11½ ft. a day in levels having a diameter of from 54 to 59 square feet, at a price of from £3 10s. to £4 12s. per foot, they providing the machinery; or at the rate of £1 10s. to £2 5s., if the necessary drills, etc., are found by the mine.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

Vol. VIII. SEPTEMBER, 1889. No. 9.

Tenure of Nova Scotia Mineral Lands.

II.

Under the Mines and Minerals Act provision was made for the surrender of any lease at the option of the lessee. The practical working of the system of forfeiture adopted by the Government of the Province, coupled with the permission to surrender, became a curious mixture of good and evil. There were many properties which had been worked, and abandoned through a dullness of trade, litigation, etc., and many had been acquired for speculative purposes. When forfeiture proceedings were initiated the owner generally surrendered his lease and took it up again. The result was that those properties only became released to parties desirous of working them when the original owners believed them valueless or were not aware of the initiation of the forfeiture process. In the case of a lessee who kept a watch over his property the applicant for forfeiture soon became tired of enriching the Provincial Treasury without being able to get possession of the coveted ground. However in many cases where capital had been expended, work, etc., performed, on a lease, and unavoidable causes had led to a more or less temporary suspension of mining operations, this power of surrender prevented unfair appropriations of valuable franchises.

Still it became evident that the best interests of the mining public were not served by this state of affairs, for it meant practically that in many districts large blocks of ground were retained by parties who could not afford the expense of an occasional surrender and release, and held their titles in the hope of benefiting by the discoveries of their working neighbours. The Government however for a number of years considered that as large amounts of capital had been invested and bona fide work performed, that it would not be equitable, even at the risk of encouraging a system of tenure for purely speculative purposes, to permit properties whose owners had been bona fide miners to have no protection from outsiders who desired to acquire at nominal rates more or less developed properties.

Finally, at the last session of the Provincial Legislature it was enacted that all future leases of gold mining areas should pay an annual rental in advance of fifty cents for each area of 150 by 250 feet contained in them, to be refunded if the labor required by law on the areas was performed. It was also settled that all future leases of minerals other than of gold and silver should pay an annual rental of thirty dollars for each square mile or part of a square

mile contained in them, to be refunded if the total amount of royalty paid in any year exceeded the rental. It was also agreed that the holders of any outstanding leases could come in and avail themselves of the provisions of the Act as respected rentals and their refund.

It must be admitted that the amount of rental charged is low, lower in all probability than would be conceded by a private individual, especially in the case of minerals other than of gold and silver, where it is, roughly speaking, about one half that charged in the other class of leases. The law, however it may work in practice, has been well received by the mining public, the investor being willing to pay a moderate rental, while it is no burden on the lessee who is working and paying his royalty. Under the former statute it has frequently happened that proposing investors were deterred by the possibility of forfeiture proceedings, and the interruption to title incident upon the surrender of a lease, while now the title becomes practically held under the safest of all conditions, an annual acknowledgement thereof on the part of the Crown.

In the absence of any discretionary power it becomes evident that the treatment of defaulting lessees is governed by fixed laws which inflict upon the legitimate miner who had done his best, and had worked faithfully but with ill-success, greater trouble than on the speculator who had risked only the fees necessary for acquiring title. The idea of a rental compromise was a happy endeavor to unite flexibility and tenacity of title. Under the United States law the acquisition of the absolute title by a fixed expenditure, has locked up many mines, and has deprived the mining industry of opportunities of benefiting by legislation; but there is an attraction about absolute ownership that is valuable in any attempt to secure title to mineral lands.

Under the conditions governing the revenue of the Province of Nova Scotia the problem of the best method of handling its mineral resources so as to benefit the miner and maintain the royalty returns is a difficult one. Practically speaking the mines royalty is the only elastic source of revenue, as the Dominion grant is virtually a fixed one. It therefore became necessary to retain the system of leasing in order that the source of revenue should not pass out of the hands of the Government, and to impose a rental to prevent speculative monopoly. The value of the royalty account may be learned from the following figures giving the gross revenue from 1880 to 1888:—

Year 1880.....	\$ 70,440.52
1881.....	101,705.35
1882.....	108,809.51
1883.....	121,970.64
1884.....	100,678.36
1885.....	119,229.37
1886.....	126,856.91
1887.....	148,773.79
1888.....	153,818.30

The cost of running the Department has been raised from \$6,000.00 to \$14,000.00, and in this expenditure is included large payments for schools of instruction for miners, begun under the auspices of the present administration.

The Province deserves commendation inasmuch that a steadily maintained policy has preserved to it most valuable mineral franchises yielding an important and increasing revenue, while at the same time all proper legislative assistance, security of title, and an impartial miner's court are conferred upon the lessees, instead of having to deplore the granting at nominal rates of mineral rights liable to any monopoly, and to the inevitable diminution of value arising from change of boundaries, unchecked and reckless working, and the interminable toils of land title.

Raw Phosphates.

The evidence for the use of the crude Canadian Apatite, finely pulverized, is constantly accumulating. Many cases are reported where its application as a fertilizer has produced marked results.

Its effect upon flowers is clearly established. The enterprising foreman of the Emerald mine, Capt. Henwood, has been accustomed to take the fine dust obtained in drilling holes in the phosphate and apply it to his flower beds, and he vouches for its benefit. Capt. Adams, of Montreal, has taken a great interest in this question and has widely distributed samples for tests. He states that in four different cases where raw phosphates was applied to pansy seeds in competition with some in identical soil without phosphate, the plants and flowers of the former were double the size of the latter and survived a winter out of doors while all the other plants perished. A similar advantage as to growth was obtained with carrot seeds. In an interview with him this week he informs us that he has seen great results this summer upon a farm in Maine, and has eaten string beans raised by Canadian phosphate three weeks ahead of the season. He allows us to publish the following testimonial:—

Blue Hill, Maine, July 27, 1889.

Capt. Robt. C. Adams,
Managing Director,
Anglo-Canadian Phosphate Co., Ltd., Montreal.

Dear Sir,—I have used the crude ground phosphate from your Battle Lake Mines upon portions of various crops, and in every case the benefit is apparent. Two adjoining plots were planted with beans, one with stable manure and one with raw phosphate and manure. The latter came up a week earlier and is now a fortnight ahead of the other. The visible difference is very marked.

Oats were planted in three sections:—1, without manure; 2, with Bradley's superphosphate; 3, with raw phosphate. No. 3 has yielded the tallest crop and heaviest grain, and is more developed every way. No. 2 was better than No. 1, but the improvement was not so great as between No. 2 and No. 3.

Potatoes were tried with raw phosphate and without any manure. In one field there was not much difference to be seen, but in another the raw phosphate produced the largest potatoes.

With peas the results were decidedly good. The rows treated with raw phosphate are more forward than those that received no dressing.

Experiments have been made upon grass, but the effect of the raw phosphate cannot yet be determined.

The results obtained are such as to satisfy my mind as to the fact that crude mineral phosphate is an effective and quick acting fertilizer, and in these cases has proved superior to the other substances tried.

I am, yours very truly,

(Signed),

ERNEST R. DODGE.

We consider this topic of vast importance, as it means a reduction of from one-half to two-thirds in the cost of fertilizers to the farmer. It also permits the utilization of low grade phosphates heretofore valueless. The establishment of this theory, namely, that phosphate does not need to be treated with sulphuric acid in order to be made available for plant food, will be an inestimable boon to the agriculture of the world and will give a marvellous impulse to the phosphate industry of Canada. We shall welcome further evidence tending to the establishment of these ideas.

The Visit of the American Institute of Mining Engineers to Ottawa.

As already intimated in these columns, Canada is to be honored this year with the Autumn Meeting of the American Institute of Mining Engineers, which will be held at Ottawa during the week commencing Tuesday, 1st October, next. No better description of the growth and progress of this admirable institution can be given than that of Mr. Wm. B. Potter, E.M., St. Louis, who, in his Presidential address at the New York meeting, held in the beginning of the present year, said:—"The Institute is now fast approaching the year of its majority. More than eighteen years ago it came into existence in the town of Wilkesbarre Pa., and was welcomed as a long-desired heir, who should, in time, gather together and organize the scattered and neglected interests of the great estate of the profession, and be the means of adding new riches of knowledge to the store and new honor to the name, as well as benefitting mankind. The achievements of all these years have proved that the expectations were not in vain. The twenty-two who first assembled at Wilkesbarre to organize the Institute are, many of them, still with us; but their number has increased, until there are eighteen hundred and more. All parts of this continent are represented in the membership, as are the chief countries of Europe and South America and parts of Asia, Africa and Australia; and the list embraces the names of many who have been foremost in the achievements of all branches of the profession. The fifty-two meetings that have been held in the leading industrial and commercial centres of the land have been the means of extending the influence and reputation of our calling and promoting the influence of true science and sound practice. Not far from a thousand papers have been contributed upon subjects relating to the constitution and occurrence of nature's varied stores, as well as their exploitation, preparation and treatment to adapt them to the use and benefit of mankind. The sixteen volumes of published *Transactions* containing this lib-

eral contribution form a rich and useful store and furnish abundant proof of ability and zeal as well as faithfulness of members to the cause the Institute upholds."

A suggestion from the Canadian members to hold the Autumn meeting of the Institute at Ottawa having been very warmly received at the New York meeting, steps were at once taken to accomplish this end. A meeting was held in the office of the REVIEW early in March, which eventuated in a large and influential gathering of the citizens in the City Hall. Delegations to the Federal, Ontario and Quebec Governments were still further encouraged by grants of one thousand dollars from each to a fund for their reception. A formal invitation to the Council was sent and at once accepted. The following may briefly be stated to be the programme prepared by the committee for the occasion:—

Tuesday, (1st October)—Evening session.

Wednesday morning—Drive to the Chaudiere Lumber Mills and Factories, Experimental Farm, &c. Afternoon and evening sessions.

Thursday morning—Drive to Parliament and other public buildings, Geological Survey, Museum, &c. Afternoon and evening sessions.

Friday—Excursion by rail and river to the Lievres Phosphate mines.

Saturday—Excursion to the Canada Copper Co's mines and works, Sudbury, and on to the silver mines at Port Arthur.

Excursion to the Eastern Townships, visiting the Asbestos mines at Black Lake and Thetford, the Rockland Slate Quarries, the Dudswell Lime and Marble Works, &c.

The Buckingham excursion will leave Ottawa about 8.30 in the morning. At Buckingham village, steamers and scows sufficient to accommodate several hundred will be provided by the mine owners to convey the party up the Lievres. At the Little Rapids lunch will be served in a large marquee, and an opportunity given to visit the mines. As it will be impossible to see the larger mines, further up the river in time to return to the city on the same day, accommodation will be furnished at any of the mines to any of the engineers who may wish to remain over night.

At 1.50 Saturday afternoon a section of the Institute will leave for Sudbury and Port Arthur. Sunday and a part of Monday will be spent at Sudbury, where the mines and works of the Canadian Copper Co., the Dominion Mining Company etc., will be visited. At Port Arthur, the Mayor and Corporation will tender the distinguished visitors a public reception. Arrangements will also be made to allow them to visit and inspect the Beaver, Silver Mountain and other well known mines in the neighborhood. The whole trip will occupy a week or ten days, and will fully absorb the amount voted by the Ontario Government, *ie.*, one thousand dollars.

The excursion to the Eastern Townships will also leave Ottawa on Saturday, 5th October. The train is timed to reach Sherbrooke early on Monday where a Special will convey the party to the Asbestos mines at Black Lake and Thetford. At the latter point the mine owners and

managers will tender the visitors a lunch. At Sherbrooke, the Mayor and Corporation will give a reception in their honor on Tuesday. The new Rockland Slate Quarries, the Harvey Hill Copper Mines and other places of interest will in all likelihood be visited.

In all of these excursions transportation and Pullman facilities will be furnished without expense to the visitors.

The Sessions will be held in the large suite of rooms in the House of Commons, known as the Railway Committee Rooms. These all adjoin one another, and in one at least there is ample accommodation for two or three hundred at a sitting.

We are in a position to announce the following among other papers to be presented at the meeting:—

"The Geological Relations of the Nova Scotia Minerals"
E. Gilpin jr., Deputy Comr. of Mines, Halifax.

"Notes on the Gold Mining Interests of Nova Scotia."
John E. Hardman, M.E., Oldman, N.S.

"The Canadian Phosphate Deposits."
Dr. Robert Bell, Asst. Director, Geo. Survey.

"The Silver Veins of the Port Arthur District."
E. D. Ingall, M.E., A.R. S.M.

"The Mining Interests of Eastern Quebec."
Dr. R. W. Ellis, Geological Survey of Canada.

"A Reminiscence of Fierberg."
Thos. Macfarlane, F.R.S.C., Ottawa.

"The Possibilities of the Iron Manufacture at Ottawa."
John Birkinbine, Editor *Iron Age*, Philadelphia.

"The Sudbury Copper Mines and Works."
Dr. E. D. Peters, Jr., Sudbury.

"Notes on Some Coals in Western Canada."
W. Hamilton Merritt, M.E., Toronto.

"Gold Quartz."
W. M. Courtis, Detroit, Mich.

"Remarks on the Metallurgy of Tellurides."
Frank C. Smith, Ann Harbor, Mich.

"Ventilation, Progress and Cost of the New Croton Aqueduct."
J. P. Carson, Dobb's Ferry, N.Y.

"Stamp Mills."
John Hays Hammond, San Francisco, Cal.

"The Wear of Rails as Related to Their Sections."
P. H. Dudley, New York.

"The Columbia Iron and Steel Works, Pittsburg, Pa."
G. W. Maynard, New York.

"The Huantla Mining District, State of Morelos, Mexico."
G. W. Maynard, New York.

"The Physical Properties of Aluminum, and a Comparison of it with Other Metals."
W. J. Keep, Detroit, Mich.

"Phosphorus in Cast Iron."
W. J. Keep, Detroit, Mich.

"The Davis-Colby Roasting-Kiln."
S. G. Valentine, Lebanon, Pa.

"Commercial Economy."
Dr. R. W. Raymond, New York City.

"Biographical Notice of William W. Scranton."
Dr. R. W. Raymond, New York.

"Canada's Great Geologist, Sir William Logan."
Dr. Robert Bell, Ottawa.

"Biographical Notice of George H. Cook."
J. C. Smock, Albany, N. Y.

The date of the Meeting will, unfortunately, preclude the attendance of many of the professors of the American Mining Schools, since the opening of the school term requires them to be at their posts. A large number of members have just returned from a European trip of several months; some are still abroad; another considerable number attended the Colorado meeting in July, and these, with those who have just returned from the Toronto meeting of the American Association for the Advancement of

Science cannot get away again this year; and finally, Dr. Raymond informs us, there is a decided revival in business, blast furnaces are being blown in, contracts are under negotiation, and engagements are more important and imperative than usual. In spite of all these drawbacks it is gratifying to know that the attendance at the Ottawa meeting will still be large. Their coming to the Capital of the Dominion will increase the importance of Canada and Ottawa, not only to our neighbours but to the world generally. The reading and discussion of papers of practical interest to the profession cannot fail to be interesting and profitable to our mining men; the excursions will bring our mines and immense areas of undeveloped wealth into the prominent notice of those likely to invest or to influence the investment of money in them; to say nothing of the direct and immediate advantage to our city and the Country generally to be gained from the visit of such a large number of strangers with money to spend.

We join with the Canadian members—and we are sure with all in any way connected with our mining interests, in bidding a cordial welcome to Ottawa to the members of the Institute.

Practical Economy in Gold Mining.*

B. C. Wilson, President Gold Miners' Ass'n. of Nova Scotia

In working for coal, iron, or any of the baser metals it is understood that the operations must be carried on with system and economy, because they are subject to so much competition; but gold has no competitor in the market, does not vary in price, and being the monarch among metals "Feels not the wants that pinch the poor," and yet, perhaps, there is no branch of the mining industry where economy is so essential to success, and yet so neglected in practice as in gold mining, and this is applicable the world over, though here in Nova Scotia, where we are pronounced behind the age in so many things, I think in this particular of neglected economy we are quite to the fore. Not that I insinuate by any means that as a community we are exceptionally extravagant or wasteful, but it is the remark of visiting mining engineers that there has been work enough done on the mines in Nova Scotia, if properly and carefully applied, to have efficiently and profitably developed every mine in it, while in effect but little more has been done than merely prospect them, and demonstrate their remunerative character under the most expensive and unsystematic methods. But ages ago the Jewish sage placed it on record that "the destruction of the poor was his poverty," and to this cause the poverty of the early investors, and the apathy of the local capitalists, is to be attributed the very expensive yet inefficient working of our mines in the past; and yet it is also the strongest evidence which can be adduced of the remunerative character of the Nova Scotia gold mines, that in spite of the lack of means among the pioneers in the business, and the consequently enhanced expense of "the hand to mouth" operations where hand labor had to do what steam and mechanism should have been harnessed to, that yet the Government records from 1864 to 1884 show an average yearly return of \$660 to each man employed.

Of course they worked near the surface and creamed it, or more properly skimmed it, but

when seventy men at a cost of \$100 a day were employed to do the work of a ten horse power engine, as I have seen in actual practice for months, aye for years, at a time, I think the value of the mine and absence of economy are fully demonstrated.

Of course the day of such exceptional extravagance has passed, but there is much room for improvement the province over in the methods of working, in the concentration of interests, in the systemizing and division of labor, and in the introduction of improved labor-saving machinery all supplemented by experienced, intelligent management.

As capitalists and combinations of owners absorb the small holdings of the original owners, and works of greater magnitude are inaugurated, it follows that the field for economy or extravagance is proportionally enlarged. And foremost among the difficulties, the competent and progressive manager will be confronted with, will be the prejudices of the operative miner to any innovation in the method of working the mine or reducing the ores as compared with what they have been accustomed to, for though our Nova Scotia miners compare very favorably in intelligence and ability with any in the world, yet they do not take kindly to what departs from their heretofore practice, or to any system which reduces the number of workmen, or increases the results of their labor, considering it inimical to their interests, forgetting that reduced cost of production or increased results from the ore, proportionally enlarges the field and demand for labor. But to their credit, I must testify they are open to conviction and accept the situation if it is fully demonstrated and illustrated, but the manager has got to take the initiative and do this. The men will never do it.

The concentration of machinery and power about a central shaft, or distributing point, instead of independent powers at a number of shafts on one lode or to a series of lodes, as compared with the early practice of separate hoisting and pumping from a number of shafts on one lode, or from an adjoining, perhaps not twenty feet away is a long step towards economy, and once established, there is no danger of retrogression.

OVERHAND STOPPING.

This system also tends to inaugurate a different method of working: notably from underhand to overhand stopping. I am far from advocating overhand work in every instance, but unquestionably it is the proper and by far the most economical in a great many cases. Of course it involves the original outlay for shafts and levels in advance of any return, and this is why it has never been popular with our miners; they had to get returns every month and so the underhand system became established.

Under the tribute system which prevailed in our mines for so many years, (and a most pernicious system it was) the larger lodes of low grade ore were avoided owing to the fact that the crusher in taking toll of three to four dollars per ton left but little for the miner. He preferred a narrower lode of richer ore and did not mind working a month for a ton of ore if it gave a return of two ounces. It is only within the last year or two that the larger veins have attracted attention or been considered valuable. These larger veins offer facilities for economy in mining by the introduction of power drills actuated by steam, compressed air, or electricity. There has been some prejudice against those drills, but once introduced I have every confidence they will retain their foothold. An important drawback at the present time is the limited number of men in the country who are

familiar with their use, but time and demand will remedy this. The schoolmaster is abroad in mining and we need not fear for the results.

Many of our lodes can be worked to advantage with power drills, but there are many others where the local conditions are not favorable, particularly where the vein is very thin or the lines of cleavage admit but very narrow working space, or a soft gouge admits removal with very little explosive. In such places there are chances for a revelation in economy in the one man process, that is, each man to hold and strike his own drill. I know there is a decided prejudice among our miners to this method. They are not educated to it and have an idea that it imposes more labor, which however is a fallacy.

In the early days of mining here, when the only experienced miners were from Cornwall, they all preferred to work that way, and when under contract always would do so, but "cousin John" when hired by the day was not slow to adapt himself to "the Yankee ways," and a "soft thing" as he termed it. I have in mind several lodes, now idle, some of which have been profitably worked in this way in the old powder days, and could be made more remunerative by the same method now with dynamite, and I confidently look to a revival of this process with satisfactory results. Given a vein when the conditions apply, and an importation of half a dozen Cornish miners accustomed to this mode of working and the whole lump will soon be leavened. It only requires some one to take the initiative.

BLASTING.

Associated with drilling comes blasting. It has always been the custom, is largely so yet, for each man or set of men to drill and blast their own holes; the latter at such time as suited their own convenience regardless of how many men were driven from their work, nor did the men care either, the mine paid for it all. That such a system is a relic of the past, is expensive, unsystematic, and should become obsolete goes without argument.

If as some argue the operations are so limited that this is the best way of doing, I can only say in reply, "Sell out to some one who can work it on broader principles." That many cases will occur, notably in the preliminary work incident to properly fitting up a mine, where it will be necessary to blast at unreasonable hours, I admit, but it does not follow that nearly all the blasting may not be done at times when the men are out of the mine as at change of shifts and meal hours, and that all the holes be loaded and fired by one man specially detailed for that purpose, and where practicable that simultaneous firing by battery be adopted. I have paid for knowing that there is a grand chance for economy in this operation of blasting. And just here I have been met with the assertion that men under contract cannot afford to be placed under such restrictions, and also if the contractor sees fit to use more explosive than necessary or to hustle his men out as he pleases whose business is it? he pays for it. Just so, but the mine has to pay it all in the end. And this brings up the contract question, whether it is the proper method at all or not. That depends.

In many cases contracts can be given with advantage to both mine and men, but I believe not generally so. To come to the pith of the question: Is it not a fact patent to all that a man or a number of men will not take a contract, at least not continue it, unless they can make more than day's pay, and is it not equally patent that they do not work harder under contract than by days' work, and does not every experienced manager know of the trimming and

*Read at the September meeting of the Gold Miners' Association of Nova Scotia.

combining, and nursing of a good contract so as not to make it pay *too well*? And the mine pays for it all.

And again brain is an important element to successful mining as well as brawn. It is fully conceded that many contractors bring more brain to the work than their employers,—sometimes. But contracts are given out indiscriminately, and likely as not to a man who has not sufficient executive ability to run a wheelbarrow. Their short-comings have to be paid for, and paid at both ends too. First to make good their discrepancies, and next, in the enhanced prices which it is necessary to pay their shrewder competitors, who are not slow to take advantage of these opportunities thrown in their way. And the mine pays for it all! I believe on general principles there is no better system than efficient working managers over men, and operatives hired by the day, and paid in cash every month, or, better still, every week.

I know that the contract system has the *prestige* of government precedent, and the glamour of competition to soothe the owner and satisfy criticism, and also affords opportunity for much more elegant leisure on the part of the manager, foreman, and other non-combatants, to use a military term.

CRUSHING.

That there is ample room for economy in crushing the ore I think no one will dispute. During the "tribute" days the price charged for crushing, three to five dollars per ton, acted as an incubus upon mining interests and development. And yet I have known mills charging \$2.75 per ton which did not make enough at that price to meet their bills. And it was considered a marvel of success when another mill made an average of \$1.08 on six months' running, but this made no provision for cost or depreciation. But in the light of the fact that there are mills running in America to day on ore which yields less than \$1.00 per ton, the cost for crushing alone in Nova Scotia does not look encouraging.

The ore-breaker is beginning to supplant the process of hand breaking with hammers, and the automatic feeder is also coming to the front. But if every mill owner in the Province who has these improvements would hold up his hand, would there be a show of half a score?

Of course the cost of crushing is materially enhanced by the limited capacity of the mills, and the further fact that the small lots crushed necessitates cleaning up very frequently. And an initiatory step towards reducing the cost, be the mill large or small, is to keep the mill continuously supplied with ore. Taking things as we now find them. For instance with steam power it usually takes three men to run a ten stamp mill. Now if fifty stamps were used the three men could run it still; while the concentration of power and fuel would be quite a saving. And I have no doubt that a properly equipped and operated mill could crush quartz for 50 cents a ton, presuming, of course, that fifty to one hundred tons a day are treated. And there are plenty of properties here capable of furnishing that amount and keeping it up for years; but I have yet to learn of one mine producing fifty tons per day. However I have confidence that in the very near future we shall have mines producing that, or double it.

Artificial light has to be used in a mine. What electricity will do for us is a problem the future will solve for us. It is being introduced and may become the light of the future; in the meantime candles and oil have to fill the demand. Which of these is the best is a matter of opinion among the respective advocates.

Lighting is one of the little expenses which combine to swell the bills, and sometimes very considerably. I can call to mind an instance where a miner with an eye to economy fattened two fine porkers from the ends and broken candles bailed up with the water, and picked out of the quartz! Neglect on the part of the overseers, you will say, and very truly; but the mine paid for it all. It only goes to prove what an omnipresent individual the manager of a mine needs to be to stop those thousand and one leaks.

The economizing of fuel in mines worked by steam is a matter generally receiving special attention and affords the best guarantee of improvement in the future.

In short, while it is not advisable to economize a dollar at the expense of two to save it, it certainly is consistent to make economy an important element of the management, and to bear in mind that the matter is one over which the mine manager holds sovereign control. On him devolves the duty and authority of so systemizing the work that the greatest remunerative results are obtainable; to see that the mechanical appliances are efficient; that the workmen are prompt to duty; that the drilling, blasting, and in fact all work is managed by the department, and not by the men; that shifting of rock and other unskilled labor is apportioned to the rank and file of the pay roll and not to the skilled operative, whose duties are of a higher order, and consequently involve higher wages; that there is no intentional or unintentional neglect or carelessness of the men as regards care of tools, lighting, fuel or any property of the mine; to see that there is no piling back on scaffolds, or dumping ore under foot because it is easier to do so than pass it to the surface (an outcome of the contract system); that the transport of ore from mine to mill is done with due regard to expense as well as security against pilfering or even unintentional loss; that the ore-breaker and automatic feeder are substituted for the pernicious and expensive hand process.

To keep a sharp eye upon the use of cyanide or acids either in the mortars, upon the plates, or in cleaning the gold, and prohibit the throwing away of any resultant liquors, and to restrict, or better still, abolish the use of the magnet in cleaning up or panning out, and see that no accumulations of iron from the stamps, heavy pyrites, old crucibles, slags, etc., are allowed to be thrown away or carried away; and particularly that the floor of the mill is either perfectly water tight or of sand which can be taken up occasionally and passed through the mill. For gold and quicksilver will elude the most careful manipulator. And need I mention it? To see that his men are paid promptly *whether the mill is cleaned up or not*, for the moment men find their pay is behind the specified time they take alarm and set back in harness, work with a half-hearted energy which the foreman is powerless to overcome. It is an important economy to keep your men paid promptly.

The purloining of gold by persons around the mine hardly comes under the head of economies but is none the less important to success, and one which the manager will find it necessary in practice, if he doesn't consider it judicious to establish, in principle. To reverse the time-honored English precedent and in a measure, at least, believe every man guilty until he has proved innocent. If this expression may seem to reflect too severely on the moral standard of mining humanity I have only to remark that it is not every mine which can afford to lose \$25,000 to \$50,000 a year in this way, and I can name more than one in the Province which has suffered to that extent.

PHOSPHATE.

In General.

Mr. Hutcheson, of the Anglo-Continental Guano Company (late Ohlendorffs) accompanied by Mr. P. Würzemburger, M.E., Antwerp, are now visiting the mines, and making a full investigation into our phosphates with a view to securing supplies for the immense requirements of their large fertilizing business. The visit of capitalists of such high status is a very hopeful sign of the commercial future for our Canadian phosphate trade.

Ocean Shipments.

The following is a statement of the phosphate shipments from the Port of Montreal to date, unreported since our last issue.

Date.	Vessel.	Destination.	Shipper.	Tons.
Aug. 17	S.S. Gleniffer	Liverpool	Millar & Co.	250
" 17	" Ocean King	London	Lomer, Rohr & Co.	50
" 28	" Toronto	Liverpool	Millar & Co.	425
" 30	" Gerona	London	Lomer, Rohr & Co.	392
" 30	" Osiris	Grimsby	"	200
" 31	Bk. Eidsiva	Cardiff	"	100
" 31	S.S. Concordia	Glasgow	Wilson & Green.	407
Sept. 7	" Angers	London	Lomer, Rohr & Co.	150
" 7	" Harbinger	Glasgow	"	200
" 12	" Haverton	London	"	168
" 14	" Canopus	Liverpool	Wilson & Green.	384
" 15	" Erl King	London	Lomer, Rohr & Co.	150
" 17	" Smeaton Tower	"	Wilson & Green.	200
" 20	" Alcides	Glasgow	Lomer, Rohr & Co.	250
Total				3326

Lomer, Rohr & Co.	1660 Tons.
Wilson & Green.	991 "
Millar & Co.	675 "

Total..... 3326

RECAPITULATION.

London	1110 Tons.
Liverpool	1059 "
Glasgow	857 "
Grimsby	200 "
Cardiff	100 "

Total..... 3326

Shipments.

Notwithstanding the scarcity of ocean freights and the difficulties of transportation on the Lievres, it is confidently expected that the shipments for the present year will be fully up to 25,000 tons.

Through the courtesy of Col. Lay, the new U. S. Consul-General at Ottawa, we are in a position to state that the shipments of ground phosphate from the Ottawa Valley to points in the United States, for the fiscal year ended 31st June last, were of a value of \$24,584.62—or 2,458½ tons at \$10 per ton.

The value of ground phosphate exported from Ottawa County mines to the United States for quarter ended this month is \$7,760, or 776 tons at \$10 per ton. These are the largest shipments from Ottawa County reported for any quarter during recent years.

Markets.

Markets are firm with an upward tendency. Sales have been made lately at the following quotations: 500 tons 75 to 80% at 1/ per unit, rising; and 10½d for 70% rising. The outlook for Canadian phosphate is certainly encouraging.

Ocean Freights.

Freights continue to be scarce. The following may be quoted: Liverpool, scarce @ 7/6, London from 9 to 10/, Hamburg about 14/ to 15/, Glasgow 6/6.

Kingston District.

The output from the Foxton mine from 1st May to 1st September figures 900 tons, averaging 82 per cent., together with a considerable quantity of uncobbed phosphates. The vein is now reported to be 64 feet in length by 8 feet in width, consisting of pure phosphate unmixed with rock. The above mentioned 900 tons were mined and cobbled by about 18 men. The mine is improving as the work progresses. Five hundred tons have already been shipped from Kingston.

Perth District.

Very cheering reports continue to be received from the pits of the Anglo Canadian Phosphate Company at Bobbs Lake. Particular mention is made of one of the pits which shows a vein 50 feet long, and from 3 to 4 feet wide, of solid phosphate. From this pit, four men have taken out 73 tons in four weeks. The company were unlucky enough to have 325 tons on the unfortunate s.s. Montreal which stranded lately off Belle Isle.

Templeton District.

Dr. Robert Bell, Assistant Director of the Geological Survey, paid a visit this month at the Blackburn mines. He reports that a great deal of prospecting has lately been done on the virgin lots adjoining the main workings, and that all the openings show large bodies of rich ore that will amply repay further development. More powerful machinery has been put in at the old pits and many improvements all round are being carried out. These operations have naturally interfered with the output, but hauling has lately been resumed.

Du Lievre District.

At the North Star mines new machinery is being put in place and a large output continues to be maintained. It is thought that the total product for the year will be close upon 8,000 tons.

Operations at High Rock go on much as usual. All the pits are now looking exceedingly well. 384 tons from this mine were on the S.S. Canopus which took fire on her outward voyage on 22nd inst. At time of writing it is not known how much, if any, of the cargo is damaged.

Mr. C. C. Hoyer Millar, of Messrs. Couper, Millar & Co., London, is at present on a visit to the mines of the Canadian Phosphate Company in which he is very largely interested. Mr. Millar states that all the pits look exceedingly well, and that a large quantity of phosphate is being mined and shipped.

The Squaw Hill property adjoining the Emerald, and owned by Mr. A. F. McIntyre, is reported to be looking better than ever. All the shows give abundant evidence of pay ore.

The crushing plant at Lomer's Mill is running full time. The management have in hand permanent orders for the whole production right through the winter. To date about 800 tons of ground phosphate from the mill have been exported this season to United States.

Measurement of Earth-Pressure in Mines.—In the mine at Stassfurt, belonging to the Prussian Government, the following contrivance has been adopted to measure the vertical change caused by the thrust of the strata. Wooden plugs, each a yard in length, are driven into the floor and roof. On to these plugs two

iron tubes are screwed. The tubes do not meet, but a guide-pin attached to the lower one slides up and down within the upper one. At the side of the tubes a vertical board is fixed in such a way as not to touch the roof or floor. Two metal frames are fixed to the board, so that their ends are in close proximity to the tubes. At the back of these frames is the centre of a lever, the shorter arm of which is connected with one of the tubes, whilst the longer arm serves as a pointer that is free to move over a scale divided into centimetres on the board. The pointer is adjusted to zero, and the depression of the roof and the rise in the floor are indicated by the movements of the pointer.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

The Londonderry Iron Company, whose works are near Londonderry, N. S., will pay out in wages to their workmen this season \$252,000. They will also pay the Intercolonial railway \$100,000 for freight charges.

The Steel Works, New Glasgow, are credited with making one of the largest castings ever made in Canada. It weighs 35 tons.

Killag.

Work in this district has been steadily pushed this summer by Mr. Geo. W. Stuart. The difficulties of prospecting here, owing to the swampy character of the surface, are unusually great. The surface is 31 feet deep, the first six feet consisting of black turf and mud, and the remaining twenty five of large boulders and quicksand. Early in the summer a pumping and hoisting gear was set up near the centre of the swamp, and a shaft has been pushed down fifteen feet into solid rock. From the bottom of this shaft a cross-cut to the north is driving. The tunnel is now in over forty feet, and the management expect to cut the rich lode, so long looked for, in about sixty feet more. It is interesting to note that the black turf cut through in the surface, when piled up and dried, proved to be a peat of excellent quality. Mr. Stuart has tried some of it under the boiler and reports that one fire, with closed doors, sufficed to keep up the steam whilst pumping and hoisting for two hours. Killag is blessed with plenty of good fuel in the shape of big hardwood, but this experience of Mr. Stuart's may prove of far more value than appears at first sight.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manila Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

Rawdon District.

Mr. Eugene Conrady has been appointed to the management of the Rawdon United Mines, and the British and Colonial Land Association Limited, of Mt. Uniacke, taking the place of Mr. John Nicholls.

Westfield.

The big swell of quartz, locally known as the "Jumbo" lode is not being worked now. Several reasons therefor are mentioned, but the principal one seems to be a lack of free gold.

Chezzetcook.

The drainage of Lake Catcha by the Oxford Gold Mining Co. has opened to prospecting a large territory hitherto inaccessible. The management has already cut thirty different lodes, and are now working on two lodes, each said to be about twelve inches thick. One lode shows gold freely, and is estimated good for thirty dollars per ton.

Beaver Dam.

The new owners of this property are working quietly, but steadily. The shaft is now down fifty six feet and is to be sunk to a depth of 120 feet. The belt is said to be forty feet in width, of which thirty feet, at least, is crushing material.

The ore obtained from the shaft in sinking, averaged nine dollars per ton. It is the intention of the management to have ten stamps running before Christmas, and to add more stamps as fast as the development warrants.

Malaga.

The Parker Douglas Co. is working steadily and keeping five stamps running. The Malaga Co. keep an average of about eight stamps running. But little information is accessible regarding this district, the returns to the Mines Office for the first six months of the year show an average yield of sixteen dwts. to the ton.

Cochrane Hill.

Mr. Ferd. Dietzsch, representative of the English syndicate, working at this mine for a year past, left on the 30th August. The mine is idle and has reverted to the hands of its former owners. The history of this property for the past twelve months has been illustrative of the folly of sending out English experts to manage small gold mining enterprises in this country. Unfamiliarity with the metallurgy of gold and extravagant business habits would ruin many richer mines than this.

Montague.

Quite a force of men are at work in this district. During the past six months of the year the average yield was \$33 per ton. Many very handsome and rich pockets have been found during the summer.

Central Rawdon.

The sale of the Gould-Northup mine at this place to a Pennsylvania syndicate has been announced. The property embraces nearly 45 acres. Mr. Chas. E. Willis, Manager of the Neptune Gold Mining Co., has also assumed the management of this company.

Sherbrooke.

This district reports a rich find on property lately owned by Mr. Hattie, now owned by Robt. McNaughton. The rumour is not denied by Mr. McNaughton. In other respects the district is very quiet, not more than half a dozen men being at work.

Caribou.

The Heatherington property in this district has recently been purchased by a new corporation known as the Truro Gold Mining Co. Amongst the names of the syndicate are those of some of the solid men of Truro. Work has already been started and will be vigorously pushed.

Wine Harbour.

The property here, under management of Mr. H. T. Harding, is doing well. 160 ozs. of gold were obtained last month. Some changes are to be made in the machinery plant which will increase the hoisting capacity.

Isaacs Harbour.

The output of the Palgrave Co. was considerably reduced last month owing to a breakage in the pumping gear, which occasioned a loss of eight days in the pit.

A valuable discovery of anthracite coal has been made at Cheticamp, Cape Breton, and on trial is said to have proved of excellent quality. One hundred barrels have been sent to England for analysis, and if it turns out as expected the mine will be at once developed to its fullest extent.

Quebec.

Very encouraging reports come from the New Rockland Slate Quarries. A very good quality of slate is being quarried from a productive bench at a depth of some 200 feet. A little over 16,000 squares have been taken out and made marketable since the beginning of the present year. About 200 men are now employed under Superintendent Williams. A heavy cave-in occurred recently which will delay operations for a few weeks.

The Anglo-Canadian Asbestos Company at Black Lake are quarrying an excellent quality of asbestos. During August, 103 tons were taken out, with an average of 40 men and boys. Mr. R. T. Hopper contemplates putting in an improved plant at an early date.

At the property of the American Asbestos Company, in the same district, work is going ahead very satisfactorily. There are between 100 and 120 men at work. Mr. Ed. Wertheim is working very systematically, and all openings look well.

Appropos of the scarcity of labor in the asbestos districts, a prominent mine owner writes: "Help has been very scarce in this district lately, many of the men having left the quarries for the farming districts, where, for the time being, they can earn a little more money. This is a common complaint at all the mines, and the output of asbestos is being very much hindered thereby. 150 to 200 men at least would find ready employment at the mines in this district alone. Perhaps you can do something to induce good strong men and boys to move to Megantic county. Living is cheap; comfortable houses are provided by the various companies at very reasonable terms; work is continuous summer and winter; and the place is contiguous to railway and post office. We should all prefer to have men who would stick to their places, and not wish to do farming and mining at the same time. This moving about does not pay them, for they lose time and money travelling, and very often their work at the mine, when otherwise they would have constant work at advancing wages. No skilled miners are required, as with us, nearly all drilling and hoisting is done with machinery, and the work consists in simply picking up the asbestos after the blasts, and in shifting the refuse rock on the derrick, boxes and lorries, while the boys do cobbing and cleaning." We gladly give space to the above in the hope that any of our miners who may suffer from irregular employment may be induced to make a change for the better.

The demand for Canadian asbestos continues to be strong. We are informed that sales have lately been made at the following advance on former quotations: 1st quality, \$125 to \$130; 2nd quality, \$75 to \$80; 3rd quality, \$35 to \$40; waste at \$15 per ton, 2,000 lbs, at mines.

The Thetford mines were lately visited by Mr. John Bell, his son Mr. Herbert Bell, and others very heavily interested in the Bell's Asbestos Co. (Ltd.) The party were greatly pleased with the appearance, output, and systematic management of the properties. A strong endeavor this year is being made to produce 2,000 tons. With a view to doubling the capacity of the pits, and in order to meet the enormous requirements of their business, it is understood that additional machinery will shortly be added to the extensive plant now in operation. The Bell's Company have, we hear, been awarded a large contract for asbestos supplies to the British navy.

A rather bad land-slide occurred, a few days ago, at the King property, which will seriously interfere with their operations for some time at least. Fortunately the cave-in occurred during the night, when no one was at work, otherwise a deplorable calamity, involving the loss of many valuable lives, must surely have taken place. Vigorous measures were at once taken to clear away the debris, and it is hoped that the output from the big pit will be resumed at an early date. The very nature of the ground in these Serpentine areas renders it liable to these accidents, particularly during the rainy season, and great care should be taken in the workings to avoid the possibility of their occurrence. Eagerness to produce large outputs should on no account be permitted to involve any possible risk to the safety of the men.

Mr. Wm. King continues to meet with encouraging results in the prospecting of his areas in the S. E. corner of the Township of Ireland. A number of very promising veins have been uncovered.

Work continues as usual at the Ross-Ward pits.

About 300 tons, of good quality, have been taken from the Frechette mine, to 31st August.

During the month a vein of unusually good length of fibre was uncovered at the Johnstone pit.

Complaints continue to be received regarding the non-appearance of the new government map recently prepared by Dr. R. W. Ells. It seems a great pity that a work of so much value and importance to the mining interests of the Eastern townships, should be so dilatory in publication and distribution. Much of the usefulness of the work of the Survey is often marred by the inexplicable delays which occur in the production of its Reports and Maps. Mining men are greatly disappointed that this map has not been placed in their hands before now.

We have noticed in one or two of the local papers a statement to the effect that the Harvey Hill mines had been closed down; this is not so. It is true that after the collapse in the copper market the mines were closed down until a decision was arrived at in England with regard to the treatment of the ore which had previously

been shipped in its crude state. Owing to the drop in the price of copper it was not deemed advisable to ship the ore in that condition until the smelting works had been put up, and work was consequently suspended. The mines are now working with a complement of from 50 to 60 hands, and the smelter is expected to be turning out matte in a few days. We are pleased to learn that recent openings have brought to light some new veins which promise to yield good returns. A visitor, who has just returned from the mines, informs us that there are very good prospects of this old and somewhat unfortunate property turning out a paying concern after all.

The owner of the South Ham antimony mine has commenced development work. The openings made are reported to look well.

The Graphite City Plumbago Mill, near Buckingham is now working. The new machinery and substantial buildings recently erected are very highly spoken of.

Through the courtesy of Mr. S. P. Franchot we have been favored with some beautiful samples of pottery ware, manufactured from the Villeneuve felspar, by Messrs. Oliphant & Co., Delaware Pottery Works, Trenton, N.J. About 52 per cent. of the Villeneuve spar is utilised in these manufactures. Mr. Franchot contradicts the rumour that the Villeneuve mine has changed hands.

Notice of application for incorporation is given by the Coleraine Mining Company. The capital stock of the concern will be \$600,000 in 6000 shares of one hundred dollars. The names in full and address and calling of each of the applicants are, the Hon. J. Chapleau, Ottawa, A. DeJardins, banker, L. DeMartigny, banker, Hon. A. Lacoste, advocate and Queen's Counsel, Dame Delphire Justine Dansereau, widow of the late the Honourable Louis Adélard Senecal, in his lifetime one of Her Majesty's Senators for Canada, all of the City of Montreal; the first four of whom are to be the provisional directors.

Ontario.

Sudbury District.

Our special correspondent, writing from Sudbury under date of 20th Sept., says:—

A traveller passing our quiet town by the C.P.R. would have no idea of the extent of the mining and smelting operations going on in various directions within a few miles of Sudbury. Notwithstanding this want of bustle at the town itself, the fact is that there is great activity in bona fide mining, and a large amount of money is being spent in the vicinity. The Canadian Copper Company is employing more men than ever on the three mines it is working at present, namely, the Stobie, the Copper Cliff and the Evans. It has other rich mines ready to work as soon as the demands of its furnaces require the ore. The new smelter went into operation on the 4th inst., and, like the first, it gives the utmost satisfaction. The two furnaces smelt about 300 tons of roasted ore daily. At the beginning of the month some ten train loads or about 750 tons of rich matte awaited shipment, and about 300 tons have been added since. The matte now averages 50 per cent. of metal—30 per cent. copper and 20 per cent. silver. The earlier shipments averaged only about 25 and 15 per cent. respectively.

One of the most promising features in connection with mining in this part of the country is the interest which is being taken in it by the Vivians, the great copper and nickel men of Swansea, Wales. They have had a large force of men under Mr. Merry of their own establishment at work all summer on the Murray mine, $3\frac{1}{2}$ miles north-west of this place on the main line of the C.P.R. The developments so far made appear to be satisfactory, and there is every probability that this extensive and influential firm, who were the first to prove the commercial value of the metal nickel many years ago, will establish a branch near Sudbury.

Work has been renewed on the rich copper deposit in Denison, about twenty miles from here, belonging to the Vermilion Mining Company, and it is said the Harwood mine will be reopened also. The C. P. R. Co. is extending the Stobie branch to the Dominion Mineral Company's mine and employing over 300 men on the work.

All these operations, in spite of the very low price of copper, speak volumes for the richness and other advantages of our mines, and furnish the best answer to the scientific croakers in your city who encouraged (!) us with predictions of failure at every step from the beginning.

We were lately honored by a visit from the Geological Section of the American Association for the Advancement of Science, who came here at the close of the Toronto meeting. The party included Professors Hitchcock, Hovey, Wright, Broadhead, Alexander Winchell, Claypole, Morley, Drs. Lawson and Green, Messrs. H. Winchell, State Geologist of Minnesota, and other eminent geologists. A correspondent of the New York *Tribune* accompanied the excursionists. On arriving at Sudbury they were met and welcomed by Dr. E. D. Peters, the celebrated metallurgist, who is at present general manager for the C. C. Co., and taken by rail to the various mines, the roast yards and smelters. While at the Stobie mine, a blast consisting of eight 10-foot holes charged with dynamite was fired by electricity and threw down a splendid mass of pure ore which was variously estimated to contain the enormous amount of from 300 to 500 tons. Some of your Ottawa men, who might at one time have acquired this mine for a song, would have been ready to "kick themselves" at the sight. One of the objects of the party was to visit our Huronian rocks, and the following day they were conducted to the most interesting exposures along the main line of the C.P.R. under the guidance of Dr. Bell, Assistant Director of the Geological Survey, who has been working in this district for the last two years.

Besides the C. C. Co., other companies are operating extensively. The Dominion Mineral Company, largely composed of Canadian Pacific Railway men, is developing one of its properties $4\frac{1}{2}$ miles north-east of the town. This mine was bought from Messrs. Pinard & Ducharme, and is turning out well. Some 300 men are employed. Mr. George Attwood, from England, is manager, and Mr. Ferguson assistant manager of this company.

Port Arthur District.

The chief event of late has been the visit of the Governor-General to the silver mines. Accompanied by Lady Stanley and suite he made a careful inspection of the various levels of the Beaver mine and noted the workings of the im-

proved machinery for extracting silver from the ore at the Badger mine. And from each of these mines the party were given magnificent specimens of the bronzed ore obtained. His Excellency expressed his delight at the great success attending the working of the mines and promised his hearty co-operation in any measures calculated to assist in developing a region more valuable than were it entirely of the richest agricultural character.

The advent of the American Institute of Mining Engineers to this district is hailed with pleasure. An inspection of the resources of this country by such an eminent and influential body who will see practically for themselves the mines, mills, developments, deposits, etc., will probably do more to bring us before the favourable notice of the public than all the cheap advertisements of people either directly interested in the mines themselves or who have raved about matters they imperfectly understood.

An engine, train of cars, and about twenty miles of rails for the new railway into the mining region is now on its way here, and the details of location, construction, etc., are being rapidly got into shape.

The silver mines are steadily and satisfactorily producing ore, some of which at great cost is still being shipped to England, Denver, New York, etc.

Large quantities of iron lands are still being sought after, chiefly by Americans and some of the low priced discoveries in silver are also changing hands at advanced figures.

In General.

The Sarnia Oil Company's pipe line is now at work conveying crude oil from the Petrolea district to the works in Sarnia, Ont. With the facilities of bringing in their supply of crude, the Sarnia Company is now in a position to go on steadily and regularly with the manufacture of their Northern Light brand of oil, claimed to be the best Canadian product on the market.

Statement of Silver Exported to United States from Port Arthur for six months ended 30th June last.

The World's Consumption of Charcoal.—According to Professor Winkler, the world's production of charcoal amounts to 360,000,000 tons annually, a quantity of charcoal equal in heating power to 1,640,000,000 cubic yards of newly felled pine wood. For this 2,600,000,000 pine trees, eighty years old, must have been cut, and must have occupied an area of 10,400 square miles. In a forest worked systematically, for this an area of 812,000 square miles would be necessary, an area four times that of the German empire.

Notes on the Ore Deposit of the Treadwell Mine.

(By Geo. M. Dawson, D.S., F.G.S.)

The Treadwell mine, situated on Douglas island, Alaska, is a somewhat remarkable ore-deposit, and has of late years become prominent as a producer of gold. I am not aware that any systematic description of the character of this deposit has yet been published, and this circumstance may render the following notes on its mode of occurrence of interest, while the microscopical examination of the gold-producing rock by Mr. F. D. Aeams, throws further light on the character of the deposit. My examination of the mine itself was made, by the kind permission of Mr. Treadwell, while I was on my way back from the Yukon district in the autumn of 1887.

Attention was first drawn to this deposit by the discovery of gold-placers, which were worked for several years previous to the finding of the ore, and in a few cases were found to pay well. The gold of the placers was fine, but rough and unworn in character. The placers occurred on the surface of the ore mass itself and on the rather steep slopes running down from its outcrop to the shore, and must have been produced by the natural decay of the ore subsequent to the glacial period, as they were found to lie above the boulder-clay, which fills many of the hollows and rests directly on the rock wherever it occurs. It may be noted here in passing, that Mr. Treadwell informed me that barnacles and various marine shells had been found still adhering to the surface of the rock, in places from which the clay had been excavated, up to a height of 150 feet above the present sea-level.

The ore-mass, which has been extensively exposed by stripping and proved as well by several drifts, has a thickness of about 400 feet. Its length, or at least the length of that part of it which will pay for working, is not accurately ascertained but must be considerable. It runs in a general northwesterly direction parallel to the shore of the eastern side of Douglas island and is bounded to the northeast and southwest by dark, rather than slaty argillites, which, from analogy with similar rocks which I have examined on the coast of British Columbia, to the southward, may very probably be of Triassic age and referable to the Vancouver series of the reports of the geological survey of Canada.* On the northeast side, in the immediate vicinity of the Treadwell mine, the ore-mass is bounded by a zone about seventy feet in thickness of greenish schistose slate, but it is uncertain whether this zone owes its character to peculiar alteration, or to a difference in original composition, as the slaty rock as a whole do not show any marked degree of alteration in the vicinity of the ore. A 'slate' horse more or less completely silicified is passed through in one place in the main working drift, but its character as a portion of the country rock is still clearly apparent. The argillites or slaty rock are often found to be flexed and tinted at high angles along this part of the coast, and it is probable that the main period of elevation of the coast ranges has been subsequent to that of their deposition.

The ore itself presents none of the characters of that of an ordinary lode or vein, being without any parallel banding or arrangement of its constituent minerals, and showing no such coarse crystalline structure as a lode of larger dimensions might be expected to exhibit. It is, on the contrary, a nearly homogenous crystalline mass, of medium grain, and pale grey in

*See Annual Report Geo. Sur., Can., 1886, p. 10 B.

colour, evidently consisting principally of quartz and white feldspar with a little calcite, and specked throughout with small cubical crystals of iron pyrites. The quartz, however, as well as the calcite and pyrites, may occasionally be found traversing the mass in small irregular veinlets and stringers, and the pyrites in some instances forms little distinct aggregations or bunches.

A clue to the true nature and origin of this deposit (otherwise of a somewhat similar enigmatical character), appears to be afforded by the existence in it, in some places, of kernels of a distinctly granitoid appearance. Some of these were observed to be six inches in diameter, and portions of others were found which may have had a diameter of several feet. The material of these kernels—which around their edges blend imperceptibly with the main mass,—is similar in size of grain to that of the ore-mass itself, but includes little or no pyrites. It is harder and less evidently decomposed, often greenish in tint from the development in it of chloritic minerals or reddish, and microscopically examined, shows two feldspars with some quartz. In general aspect it in fact resembles the varieties of fine grained granite which are frequently met with near the junction of an ordinary granite with other older rocks through which it has broken.

The impression formed from such examination of this remarkable deposit as I was able to make is, in fact, that it represents the upper portion, or "feather-edge" of a granite intrusion, probably contemporaneous and connected with the characteristic granites of the neighboring Coast Ranges, but which, owing to peculiar conditions, has become decomposed and silicified by solfataric or hydrothermal action, to which the concentration of gold in it and the deposition of pyrites, are also due. To what extent the presence of gold may depend on the occurrence of the adjacent slaty argillites, (elsewhere known to contain auriferous quartz-veins) it is impossible to say, but it appears not improbable that the deeper portions of these rocks may, under the action of such heated solvent waters, have afforded both the gold and the pyrites. It is conceivable that the hydrothermal action which has affected this part of the original granitic magma may have been due to the water included by the mass itself while in a state of "acqueo-igneous" or "granitic" fusion, the escape of such water through the substance of the upper part of the upper part of the intrusive mass being rendered possible by the relief from pressure consequent on the approach of the intrusion to the actual surface. It may, however, perhaps with greater probability, be supposed that the water included in the adjacent sedimentary deposits, became vaporized by the heat of the intrusive mass, and found its way to the surface in the form of steam through the substance of that mass. It will be noticed that Mr. Adams finds evidence in the microscopical character of the rock of much crushing and fracture, so that in any case it must have afforded a convenient channel for the passage of heated waters or steam, and this appears to have been one of the more important circumstances leading to its mineralization.

The slaty rocks themselves in the vicinity of the ore-deposit are traversed by numerous small veins of quartz; and at the distance of a few miles (on the mainland opposite Douglas island in "Silver Bow Basin") similar rocks are found to be cut by quartz-veins of greater width, which holds visible gold. The association of metalliferous quartz-veins with masses of granite or other intrusive rocks traversing sedimen-

tary deposits is a fact of general observation. Had the higher portions of the rocks, which may at one time have completely covered this particular granitoid intrusion, remained, it might be anticipated that it would be found to pass upward into one or more ordinary auriferous quartz-veins, these filling fissures through which the heated waters ultimately reached the then surface. In depth the present ore mass should be found, on the other hand, to pass gradually into ordinary unaltered granite. Many cases of course occur in which intrusive masses have led to the formation of metalliferous deposits of an intermediate character, such as the one here naturally exposed by subsequent processes of denudation appears to be. This deposit therefore affords an interesting example of the manner in which intrusive masses may directly give rise to ordinary metalliferous veins.

The quantity of gold contained in the ore of the Treadwell mine is small. Though not informed as to the actual yield, I believe it to be on the average less than \$10 to the ton. The ore is, however, easily and cheaply obtained by work resembling quarrying rather than mining, and can in consequence be profitably worked on a large scale. It is not intended here to enter into particulars as to the mode of working, but it may be stated that at the time of my visit 120 stamps were constantly employed, and that since that date this has been increased to 240, the quantity of ore milled daily being now reported at from 500 to 600 tons. A considerable proportion of the gold is "free" and this is saved on amalgamated plates. The remainder is contained in the iron pyrites, which is separated by Frue Vanners. The pyrites was then formerly roasted in revolving cylinders, but these were being replaced at the time of my visit by continuous automatic furnaces similar to those employed in sulphuric acid works. The gold is dissolved from the roasted product by chlorine gas, and precipitated by sulphate of iron.

As the geological conditions are very similar along the west coast all the way from Lynn canal to the strait of Fuca, it appears highly probable that other deposits of a similar character to that here described remain to be discovered. With the facts developed in connection with this mine in view it would appear to be well worth while to subject to examination and assay all pyritous and granitoid rocks in contact with or penetrating the sedimentary formations, and in particular those which may be found to traverse the slaty argillites of the formation above referred to as the Vancouver series.

Meeting of the British Columbia Smelting Company.

An extraordinary general meeting of the shareholders of the British Columbia Smelting Company was held during the month in London, Mr. W. J. Steele in the chair, to consider the present position of the company.

The chairman, after regretting the unavoidable absence of Mr. Birkin (one of their directors) and Mr. Tullis (the secretary), said it devolved upon him to read the notice convening the meeting, which he proceeded to do. Continuing, he said it would, no doubt, be in their recollection that on March 20th they held a private meeting of the principal shareholders, to lay before them the state of the company's affairs up to that date. At that meeting the directors gave them all the information in their power, and the shareholders unanimously resolved on the dismissal from the service of the company of Mr. George de Woolf, Mr. Dowling

and Mr. Davis. On the same day the board telegraphed to Vancouver to shut down the works and mine and discharge the men, except the local secretary, appointing only caretakers; and that was what was done as the result of the meeting of shareholders. Since that date every care had been taken of their property and machinery, which was thoroughly protected from the weather. It was also at the time considered necessary to obtain without delay an expert's report on the position of affairs; and on the recommendation of one of the large shareholders of the company, to whom he was personally known, the board authorised Mr. Judkins, of Leadville, Colorado, to proceed to Vancouver to report on the smelter and the mine and the prospects of the company, and desiring him to give any recommendations or suggestions he thought fit. Mr. Judkin's report was a very lengthy document and very exhaustive. The chairman then read a summary of the report, which referred to the general condition of the property, and pointed out that some £40,000 to £60,000 more capital was required to fully develop the mine and place the smelting operations on a sound footing. The directors had many anxious consultations on this report, and they thought it useless to try to raise the amount by a reconstruction of the company. They had had accounts made up, including the accounts from Vancouver, as far as that could be done. The figures were made up to about the end of May, since when very little had been done. The total amount of capital paid up was £23,580, and the amount they had on overdraft at Vancouver no doubt amounted to £7,400. That showed £30,980 funds entrusted to the company, which, he might tell them, had all, or nearly all, been spent. He then referred to the expenditure, pointing out that under the general charges were £358 for London expenses. Salaries and wages in British Columbia amounted to £6,496. Under the head of general charges was £1,000 paid to Mr. George de Woolf under an agreement between himself and Mr. Vautin, by which he received £1,000 when he left to take up the management of the property. Mr. Judkins' report had cost them about £250. The smelter had cost them £3,455, and other items made up the balance. They had 31½ acres of land which had a water frontage, and went back to the south of the Canadian Pacific Railway; five acres were on the north side of the line, and 38½ on the south side. This land was becoming very valuable. That on the north side of the railway was valued at 2,000 dols. per acre. The corporation of Vancouver were to make a street through a part of the land south of the line, which would make the land very much more valuable. Believing implicitly in the rapid and wonderful prosperity of Vancouver, he should say that almost any land in the city or adjoining it would become of very great value. A letter was read from Mr. Birkin, one of the directors, expressed the opinion that the failure of the company was due to Mr. Vautin having been entirely misled as to the value of the mines, and to his appointing Mr. G. de Woolf as manager while the local board had no control. Mr. Birkin thought there were only two courses open to them—to raise the money *pro rata* to pay off the mortgage, and then to wind up the company or sell it, or to take Mr. Judkins advice and raise £60,000 capital; but he did not recommend this course. The chairman then went on to refer to an action brought by Mr. G. de Woolf for wrongful dismissal and money due, which action was now *sub judice*.

A long discussion ensued, in the course of

which the chairman stated that the mortgage to the Bank of British Columbia falls due on the 10th inst. Ultimately it was decided to request the bank to extend the date, and the meeting was adjourned until the end of October. The report of Mr. Judkins and the statement of accounts in the meantime to be printed and circulated.

On the Microscopical Character of the Ore of the Treadwell Mine, Alaska.

(By Frank D. Adams, late of the Geological Survey of Canada.)

The material employed in this examination consisted of several small specimens kindly placed at my disposal by Dr. Geo. M. Dawson, who collected them at the Treadwell mine in 1887, together with two collected by R. G. McConnell, of this survey, who visited the mine when returning from the Yukon country last autumn. The ore is more or less altered granite, rather coarse in grain and of a light grey color. As mentioned by Dr. Dawson in the previous paper it encloses "kernels" often greenish in color and distinctly granitoid in appearance, having a diameter of from six inches to several feet. These are of the same grain as the rest of the mass, but are harder and less evidently decomposed, and pass rather sharply but imperceptibly into the ordinary grey granite. As these represent the granite in its least altered form they will be described first.

The Kernels.—One of the hand specimens shows a portion of one of these "kernels" which is seen to differ from the ordinary granite in two particulars: 1st, in being light reddish color instead of grey; 2nd, in being free from quartz veins and holding but little pyrite. When a thin section is held up against a dark background it is seen to be made up of numerous rather large translucent crystals or individuals closely packed together, but separated by narrow, transparent, intermediate lines. Under the microscope these translucent crystals are seen to be feldspar a good deal decomposed (which accounts for the opacity) while the intervening spaces are found to be in part grains of quartz or of broken feldspar and in part the edges of feldspar crystals, which are often much freer from decomposition products than their central portions.

Most of the feldspar is untwinned, and is referred to orthoclase. A much smaller amount, however, shows polysynthetic twinning, in a few cases two sets crossing at right angles, and is therefore plagioclase. In one of the sections a few large grains showing perthitic intergrowths were seen. Both feldspars often possess a marked zonal structure, caused or accentuated by the accumulation of decomposition products along certain concentric lines. Although many of the feldspar individuals extinguish simultaneously over their whole extent many others show the peculiar mottled extinction produced by pressure, while others again are distinctly seen to be in the act of breaking up into a mass of small grains. Both feldspars also, although having more or less perfect crystalline forms, are almost invariably broken into little grains around their edges, which gives them a somewhat rounded contour, the edges being often highly serrated. In addition to these feldspars the rock contains quartz, hornblende, epidote, ilmenite, sphene (?), apatite, hematite, calcite, chlorite and pyrite.

The quartz is present in rather small amount, and lies chiefly in corners or between the large feldspar individuals. It is uniaxial and positive, and shows an uneven extinction. Judging from its mode of occurrence, it is in great part

composed and show mechanical deformation, the at least a primary constituent of the rock. The hornblende occurs only in very small amount, and is not seen in all sections. It is pleochroic in light green and yellowish green tints, and is without good crystalline form, being somewhat fibrous in character, the extinction making an angle with the cleavage, for which the highest value observed was 17° . The epidote is present in small quantity, in irregularly shaped grains, or aggregates of grains, often associated with the hornblende. It shows the characteristic pleochroism, and is probably secondary in every case. Primary epidote does however occur in a similar, but unaltered mass of biotite granite, which is erupted through rocks of the same series as those cut by this granite on Wrangell Island, Alaska. (See appendix 5 B, Annual Report of the Geological Survey of Canada, 1887). A small amount of ilmenite or titaniferous iron ore is also found in the sections. It is opaque and black, sometimes having a slight reddish tinge by reflected light. In one case a few small grains were seen imbedded in broken feldspar. Each grain had been broken into several pieces, which lay close to one another, and were cemented together with a greyish material resembling leucocene, which is frequently observed associated with the iron ore in this rock. A few little flecks of hematite are seen as inclusions in the feldspar. The sphene and apatite are present in small amount, the latter being in rather short and stout crystals.

In addition to these minerals the rock contains remains of some mineral now replaced by aggregates of decomposition products which frequently present rather perfect oblong outlines, as if the original mineral had possessed a pretty good crystalline form. The principal constituent in these aggregates is calcite, which occurs in grains having the peculiar silvery white color usually exhibited by this mineral between crossed Nicols. Associated with it is chlorite, epidote, and often very small amounts of quartz, pyrite, and ilmenite of magnetite. In one of these masses a grain of light green somewhat fibrous hornblende was found filled with calcite grains and associated with epidote, chlorite and hematite. The mass appears originally to have been all hornblende, of which these other minerals are decomposition products, in fact all these aggregates probably represent original hornblende grains, chlorite, quartz, calcite and epidote being the minerals into which the hornblende of granites usually splits up in decomposing.

The examination of the "kernels" therefore shows that they are composed of a considerably crushed and altered granite, probably belonging to the class of hornblende granites.

The Ordinary Granite.—The grey granite which constitutes the mass of the rock and encloses the "kernel," in the hand specimen shows no perceptible foliation and is impregnated with pyrite and quartz, the latter occurring also in the form of little veins traversing the rock in various directions. The quantity of these minerals present however varies considerably in the different specimens. When examined under the microscope the rock is found to be composed of orthoclase, plagioclase, quartz, calcite, pyrite, with in some cases a very small amount of titaniferous iron ore and of some zeolite. Hornblende, chlorite, epidote and the other accessory minerals above mentioned were not found in any of the sections.

As in the case of the "kernels" the rock exhibits a very distinct cataclastic structure, induced apparently by crushing, but the crushing has gone much further in some cases than in others. Both feldspars are more or less de-

twin lines of the plagioclase being often bent and the crystals fractured and faulted transversely, and often presenting an appearance of having been shoved into one another. The individuals of both feldspars are usually surrounded by borders of broken grains from which arms of similar broken material frequently extend into the unbroken grains. In many other cases when the feldspars are examined between crossed Nicols they can be seen to be in the act of falling apart into a number of grains similar to those constituting the above mentioned borders. The orthoclase is present in larger amount than the plagioclase, but as in the case of the "kernels" the latter mineral is as a general rule rather better crystallized than the former.

Whether any of the quartz was an original constituent is a question which it is impossible to determine. A large amount of this mineral however is always present and most of it is of secondary origin, occurring in the rock in veins or in irregularly shaped masses. Small veins are found in all the specimens and are often seen sending off lateral arms into the rock. The quartz is clear and colorless and often contains lines of minute cavities. It is usually in large individuals, which although occasionally, especially in the narrow portions of the veins, show an uneven extinction, generally extinguish simultaneously over their whole extent. A considerable length of the vein is often composed of a single individual. The edges of the veins against the rock are well defined and the component grains come together along sharp lines without any of the interstitial broken material. Calcite often occurs associated with the quartz sometimes filling a portion of the same vein. In some cases it even preponderates over the quartz, forming the principal constituent of the vein. The quartz with its associated calcite is also seen in some sections in irregularly shaped masses, which, though pretty sharply defined against the more or less decomposed rock, at other times occur so that it is impossible to determine their exact limits owing to an impregnation of the rock about their edges, with the minerals of the vein. In these veins and masses both minerals occur in large grains. Very irregular-shaped masses of the calcite, also clearly secondary and often associated with pyrite are also found, especially in the crushed and broken portions of the rock. As before it occurs in large grains, frequently enclosing little bunches of a black, rod like mineral. Little isolated crystals of calcite also occur in a similar manner. The calcite does not occupy cavities into which the other minerals have crystallized but seems to have eaten its way into the feldspar, in some cases showing crystalline boundaries in the substance of the latter. Pyrite is present in considerable amount and is generally found well crystallized in little cubes. It occurs almost invariably in the crushed and broken portions of the rock and is very frequently associated with the calcite. In one slide, reproduced in figure 1, a mass of pyrite was observed enclosing a fragment of orthoclase, evidently a corner broken off from a large individual adjacent to it and with which its orientation was identical. In the figure the clear spaces show unbroken fragments of orthoclase separated by broken material, the result of crushing. A number of these small grains near the top of the cut, which are bounded by a somewhat heavier line, show one of the large fragments in the act of falling to pieces, a phenomenon which can be observed in most of the slides, when they are revolved between crossed Nicols. A number of the little cubes of pyrite are seen in the broken portion. After the corner of the large orthoclase individual had been

broken off, the pyrite was evidently deposited in the crack and around the detached fragment. The other little white spaces in the same pyrite mass represent little inclosures of quartz. These facts together with the occurrence of the pyrite almost exclusively in the crushing portions of the rock clearly prove the secondary character of this mineral.

FIGURE 1.

Section of the granite showing cataclastic structure with deposition of secondary pyrite. Magnified 32 diameters.

As it was a point of much interest to ascertain if possible the manner in which the gold occurred in the rock, the sections, twelve in number, representing five hand specimens very carefully examined by reflected light. In ten of them no trace of gold could be detected, but in the other two both from the same hand specimen, a few little bright yellow spots having exactly the color of gold could be distinctly seen in three of the pyrite grains. These spots were quite different in color from the pyrite, and easily distinguished from it. Figures 2 and 3 represent two of these grains of pyrite with their inclusions of gold. In order to make certain of the character of the yellow spots, the cover was removed from one of the sections and a portion of the section containing the grain of pyrite seen in figure 3 was

FIGURE 2.
Grain of pyrite holding inclusions of native gold, magnified 43 diameters.

removed to a clean glass slide and treated with hot concentrated nitric acid. The acid was found to dissolve away the pyrite with effervescence, leaving the bright yellow sponges of gold behind. The gold therefore occurs in part at least, in a free state and imbedded in the pyrite; no gold could be detected except in the pyrite. The zeolite mentioned as occurring in the rock is present in small amounts, and is not

FIGURE 3.
Grain of pyrite with inclusion of native gold.

seen in every section. It is evidently secondary, occurring in small irregular-shaped masses as a micro-crystalline aggregate. The individual grains were too small to allow its optical character to be determined. The cover was however removed from one section containing it, and the rock was treated with concentrated hydrochloric acid in

the cold for half an hour. On treating with fuchsine the aggregate was found to take up the coloring matter readily, showing that it had been decomposed by the acid, and is probably one of the zeolites.

It is a matter of difficulty to determine whether any cases of secondary enlargement are to be found in the sections. I believe however that in some cases the broken fragments have commenced to grow again by secondary deposition of material around their edges, although on account of the ragged character of the latter due to breaking away of fragments by crushing, it is very difficult in some cases to determine whether an irregular boundary is the result of crushing or of a secondary growth. The outline of some grains is very similar to that of a feldspar crystal showing secondary enlargement which is figured (Fig. 1, b.) in the preliminary notice of a paper on the Archean Geology of Missouri by Erasmus Haworth, (John Hopkins University Circulars, No. 65, April 1888). The feldspar of the rock is generally much clearer and more transparent along the borders of the veins and irregular masses of secondary quartz. In one case an individual of decomposed plagioclase was observed which was very clear and fresh where it approached a quartz grain. Both fresh and decomposed portions had the same orientation, and it is possible that the clear portion may have been an enlargement of the original grain.

In order to ascertain the character of the rock around the edge of the "kernels" where a transition between the two varieties might be looked for, two sections were cut from a small hand specimen one-half of which consisted of a portion of a "kernel" and the other of the usual grey granite. The granite near the "kernel" was found to resemble the ordinary granite in containing a considerable amount of pyrite though less than the more altered granite usually holds, as well as in the fact that all the hornblende and epidote, and practically all the chlorite has disappeared. A number of oblong forms were also to be seen, being of the same shape as those described in the sections of the "kernels" as probably decomposition products of hornblende. This rock however shows these in a still further stage of alteration, being now composed of an aggregate of calcite grains, often with a little pyrite and iron ore. The rock also contains some quartz, a portion of which occupies corners and is more or less broken and probably a primary constituent, while the rest occurs in a few irregular-shaped aggregations associated with calcite and pyrite in crushed portions of the rock and is secondary. The rock near the edge of the "kernels" therefore may be said to be intermediate in character between that of the "kernels" and the ordinary granite, but to resemble the latter more closely than that of the former. It is probable that some of the calcite masses found in the ordinary granite may be remains of the hornblende originally present but which have now to a certain extent lost their original shape owing to movements in the rock. It may therefore be stated that the ore of the Treadwell mine is a granite, probably belonging to the class of the hornblende granites, much crushed, altered and impregnated with secondary quartz, calcite and pyrite; that the "kernels" are portions of the rock in which alteration is less complete than in the mass of the granite and that at least a considerable portion of the gold present in the ore is contained in the pyrite as free gold.

A New Machine, designed by the Western Machine Works, Ottawa, is reported to be light, easily adjusted, and bore coal any thickness.

Gold-Milling in the Black Hills.†

(By H. O. Hofman, Rapid City, Dakota.)

With the exception of the exhaustive paper on the Father de Smet mill, by its designer, Mr. A. J. Bowie, Jr. (*Trans. x.*, 87), nothing, so far as the writer is aware, has as yet appeared on the stamp-mills of the Black Hills of Dakota, although they have been steady producers for the last ten years. Within the small area of about 6,000 by 1,600 feet, \$2,271,341.14 was produced in 1887 from rock averaging \$4.00 per ton in free gold.

I. THE ORES.

Character of the Ores.—The gold of the district is found in quartz and pyrites finely distributed through vast bodies of mica—and amphibole-schists, argillites and phyllites, and also impregnating the schists themselves. The "Belt," embracing the section of Lead City, Terraville and Central City, is the only part worked at present.

The principal associated mineral is iron pyrite, with some arsenopyrite and chalcopyrite, garnet and asbestos.

The ores from open cuts and upper levels are more free-milling than those from underground workings below water-line. Hence the mills running on oxidized ore have tailings as low as \$0.25 per ton, while tailings from unaltered ore run sometimes up to \$2.25 per ton. By watching the pulp when it flows down the plates it can be readily determined whether the ore comes from higher or lower levels. In the former case it will generally have a brownish red color, in the latter a bluish gray. The amount of free gold in the ores varies, therefore, with the depth at which they are mined. It is difficult to give a correct average figure of its value, but \$4 per ton will be near it.

The total value of the ore is not definitely known, as its weight is not actually determined, but only estimated, and regular dry assays are not made at all.

To determine the amount of free gold in the ore, the following method is in practice: Samples are taken daily from the different workings in the mine and sent to the "sampler," who crushes them, pans them and estimates the gold in the pan. Every valuation thus made is booked, and at the end of the month the average is taken and compared with the output of the mill, and the amount of gold recovered thus approximately determined. The mode of operation practiced by the "sampler" is simple: The sample, weighing, say ten pounds, is emptied into a 4-gallon bell-shaped mortar (13½ by 12½ inches) and crushed to nut-size with a heavy pestle, swung from a spring-pole. From it two pounds are then transferred into a second mortar of the same size, with a wooden lid, and there pulverized wet to a fine pulp, by means of a small steam-stamp, which is in reality an old power-drill, fitted up for this purpose. When sufficiently fine (as judged by the ring of the pounding stamp), the pulp is panned until all pyrites and other heavy sands are washed off with the tailings, and only the free gold remains. The "sampler" of the Homestake company pans from fifty to fifty-five samples per day. Great skill is acquired in thus estimating the value of the ore, the sampler being able to make from eight to ten valuations an hour.

As these are the only determinations made, it can be readily seen that the amount of the non-free-milling gold which enters the mill is not known. The percentage of sulphurets has been determined in several instances, and varies

† Amer. Ins. M. E., New York Meeting, February, 1889.

from 2½ and 3 per cent. to 6 and even 10 per cent. The assay-value of pure concentrates, freed from rusty gold or gold that is still enclosed in quartz (the ore being not sufficiently crushed), has lately been shown to vary from \$4 to \$90 per ton, the average for the district being about \$25 per ton.

Sorting of the Ore.—As the gold is finely disseminated throughout the entire vein-matter, comparatively little sorting in the mine can be expected. There occur, however, in many parts of the veins, igneous intrusions, locally called "porphyry," which form "barren horses." When the Nevada system of timbering in square sets was exclusively in use, no distinction was made between mill-rock and waste, but it was considered that the cheapest way to get rid of the latter was to run it through the mill. Lately, however, it has become the custom to fill the chambers formed by this timbering with waste rock and to hoist any excess of it to the dump, thus sending less waste through the mill; but large quantities are still got rid of in the old way, by running through the mill; but large quantities are still got rid of in the old way, by running the mill.

II. ENUMERATION OF MILLS.

When in 1876 the auriferous gravels and lodes were discovered, there was a "rush" to the Black Hills, and in a very short time a large number of mills sprang up. Of these the seven named in the following tables are still running with 640 stamps.

TABLE I.—LIST OF STAMP-MILLS.

Name of Mill.	Year of Erection.	Location.	Name of Company.	No. of Stamps.
Homestake.....	1878	Lead City,	Homestake Mining Co.,	80
Golden Star.....	1879	"	"	120
Highland.....	1880	"	"	120
Deadwood.....	1879	Terraville,	Deadwood-Terra Ming Co.	80
Golden Terra.....	1880	"	"	80
Father de Smet.....	1878	Central City,	Father de Smet	100
Caledonia.....	1879	Terraville,	Caledonia	60

The 25-stamp custom mill, the "Cassel" mill, which was built at Central City, about the same time as these, is running principally on cement gravel and will not be discussed here.

Although the mills given in the foregoing table are owned by five separate companies, they are all, except the last, under the management of the Homestake superintendent. Thus it follows that the working details of the six mills are all, as far as practicable, after one model—the Homestake. The Caledonia mill stands alone, and works on a very different rock. Therefore the details of its plant differ considerably from those of the others.

III. OUTLINE OF PLANT AND PROCESS.

The crushing is done by means of rock breakers and stamps. The breakers reduce the coarse ore to a size suitable for the stamps. The ore, arriving at the highest level of the mill (the ore-floor) in mine cars, is discharged from the side or bottom of the car (dumping and bottom-discharge cars being both in use) over grizzlies to the crusher floor; or it goes directly to the crusher-hopper. The small ore-particles, passing through the grate of the sizing screen, and the coarse ore (which has been reduced in size by the crushers), both drop into the same ore-bin, which reaches down to the cam-floor. Here a number of chutes deliver it to the automatic feeders, each of which discharges its contents continuously into the mortar to which it belongs. Here the ore is pulverized by stamps (five in each mortar) lifted at regular intervals by corresponding cams, which are keyed to a cam-shaft, placed in front of the battery on the cam-floor. Water is fed continuously into the mortars, and forms, with the ore, a liquid pulp, which passes through a screen at the front on to and over the apron-plates on the lower floor of the building. The Caledonia mill has blankets on the lower end of these plates to catch any coarse heavy particles; in the other mills the pulp passes directly from the apron-plates to the mercury-traps and through them on to sluice plates. From the traps, placed at the end of these, the pulp runs into one main sluice which may again have one or more traps before the pulp is finally allowed to run to waste.

Thus the entire process of passing the auriferous coarse rock from the ore floor to the final discharge, at the end of the main sluice, is an automatic one.

Battery amalgamation is used to extract the gold. It begins in the mortar, where mercury is added at intervals (while the continuous fine crushing with the stamps is taking place) and ends on the apron-plates, where nearly all the amalgam not retained by the inside amalgamated copper plates is collected daily, any deficiency in the collecting mercury and amalgam on the plates being supplemented by the various traps.

As the mills on the "Belt" have to treat low-grade ores, it is necessary to their profitable operation that large amounts should be put through as rapidly as may be, and that, at the same time, as much gold as possible should be saved by simple means. To effect this, a compromise is made between the two extreme methods of gold-milling. One of these aims at extracting as much gold as possible in the battery at the expense of capacity; the other, by amalgamating outside of the battery, increases the crushing capacity, but requires a number of expensive operations to recover the gold. In the Black Hills, amalgamation is carried on both inside and outside the battery, thus combining the simple way of recovering the gold from the first method with the large capacity of the second. The aim is to crush rapidly to the desired fineness and arrange the amalgamation so that it shall be adapted to the large amount of pulp produced.

IV. GENERAL FEATURES OF THE MILLS.

Table 2 gives a comparative view of the dimensions, power, batteries, and product of the mills. The following is an explanation of the letters employed in this table:

A, Horizontal 155 H.P. engine, with Meyers cut-off. B, 300 H.P. Harris-Corliss engine. C, 350 H.P. Corliss engine, Fraser and Chalmers pattern. D, two 60 H.P. horizontal engines, with automatic cut-off; one driving forty

stamps, the other now driving twenty, but soon to drive twenty more now erecting.

a. Length and width are always of mill proper, excluding engine-room.

b. The boilers in this table are all horizontal, tubular, 54 in. diameter, 16 feet long, with 46 tubes of 3½ in. diameter. Steam pressure is kept at 90 lbs. per sq. in.

c. Made up as follows: Wrought iron stem (length 14 ft., diameter 3½ in.) 340 lbs.; cast-iron head (height 18 in., diameter at top 9 in., at bottom 8 in.) 240 lbs.; cast-iron shoe (cylindrical but 8 in. high and 8¼ in. diameter, tapering shank 4½ in. diameter at base, 3½ in. at top, 5 inch high—the shoe being made of white iron, chilled for 6½ in. from base, the next 1½ in., and the shank being cast in sand and cooled slowly), 140 pounds; cast-iron gib-tappet diameter at ends 9¼ in., in middle cylindrical part 6 in., wearing faces 2½ in. thick, middle part 7 inches long, total length 12 in.), 130 lbs. Total, 850 lbs., stem, head, shoe, and tappet being proportioned as 34 : 24 : 14 : 13.

d. Batteries in two rows, back to back, leaving this space between the rows for ore-bins and feeders.

e. From June 1, 1887 to May 30, 1888, inclusive.

f. Estimated from report of Homestake Co. June, 1888, where product of 200 stamps in Homestake and Golden Star mills (under same management and similar conditions) is given as 243,355 tons for the year ending May 30, or 1,216,775 per stamp.

g. See Report of the Director of the Mint for 1887.

h. Will be increased to 20 in., as 18 in., which was large enough for 60 stamps, is not enough for 80.

i. Formerly 12, the mill having been originally built for 60 stamps.

k. Batteries in single line.

l. Batteries in two rows, but face to face, with this space between them.

m. Intentionally slower crushing on harder rock than the other mills.

n. For year ending April 30, 1883.

o. Excluding some concentrates from preceding year.

Distribution of Power—The methods employed in transmitting power from the engine to the different parts of the mill may be classed under three types, represented respectively by the Homestake, Golden Star and Highland mills. The Caledonia may be placed with the Golden Star, and the Deadwood, Golden Terra, and Father de Smet, with the Highland, notwithstanding local variations, especially such as are necessitated in the Father de Smet by the peculiar arrangement of its batteries.

1. In the Homestake mill, the continuation of the engine-shaft forms the line-shaft of the mill and is placed on the battery sills. This is a cheap construction and gives a solid foundation for the boxes, in which the line shaft rests. The shaft is kept in line by the even pull of the long belts placed on each side at an angle of about 30 degrees. The supposed disadvantage at being obliged to stop the entire mill, if anything happens to the line-shaft, is insignificant. When the mill was built in 1878, the line-shaft was not made of sufficient thickness, in consequence of which it became twisted and broke within two years. The new shaft, having the requisite strength, has been steadily in use ever since. For minor repairs, the position of the shaft is a disadvantage. It is in an obscure place where it escapes attention, particularly as everything has to be done by artificial light.

General Mining.—Accounts to December 31 submitted in April, but an interim meeting is held in November. Dividend for 1884, 5 per cent; for 1885 and 1886, 3 1/2 each year; and for 1887, £4 13s. 9d. per cent. Reserve fund, £29,850.

Low Point.—The vendors' shares, up to the end of 1888, do not rank for dividend until 7 per cent. per annum dividends have been paid on ordinary. Accounts to Dec. 31. For 1887, 5 per cent. was paid on the ordinary shares other than those held by the General Mining Assoc., that Company foregoing their dividend rights.

North-Western Coal.—The deferred shares receive on dividend until 15 per cent. per annum (cumulative) has been paid on the ordinary. Accounts to June 30. Dividend for 1887-3, 5 per cent.

Sydney and Louisburg Coal.—Accounts to Dec. 31 submitted about May. Out of the profits of 1884 one half-year's dividend on the first preference shares was paid. No dividend since. Debit to Dec. 31, 1887, £1,574.

Vancouver Coal.—Accounts to June 30 and December 31 submitted in November and May. In the half-year to June, 1888, there was a net profit of nearly £11,000. Debentures, £57,200. Reconstruction has been decided on.

Excelsior Copper.—Registered September 26, 1888. Authorized capital, £450,000; purchase consideration, £400,000, in cash or shares. Fully-paid shares issued to the vendor; partly paid to the public.

Shuniah Weachu.—Accounts to Nov. 20 submitted in February. No dividend yet.

Silver Wolverine.—Registered October 19, 1888, with a capital of £100,000, of which £80,000 was the first issue. Most of the shares were issued to the vendor.

Anglo-Canadian Asbestos.—The Company was registered in November, 1885. Accounts to October 31 submitted in March. No dividend yet. Debentures, £3,450. Reports are not obtainable, being reconstructed.

Anglo-Canadian Phosphate.—The preference shares rank first for 7 per cent., and after a like rate has been paid on the deferred shares, both classes rank equally.

British Columbia Smelting.—The company was registered May 9, 1888. The ordinary shares were issued to the vendor, and they do not rank for dividend until the preference shares have received dividends amounting to 100 per cent.

Canadian Phosphate.—Accounts to November 30 submitted in February. Eleven months to Nov. 30, 1888, resulted in a profit of £2,576, which was carried forward.

White's Asbestos.—Registered April 9th, 1889. the authorised capital is £100,000; first issue, £60,000, of which £20,000, fully paid, was issued to the vendor.

Jackson Rae Phosphate.—Registered May 9, 1889.

Western of Canada Oil.—Accounts to March 31 submitted in May. Debenture interest is not paid. In 1886-7 there was a profit on working of £256; in 1887-8 of £690; and in 1888-9 of £1,279. Debit balance on March 31, 1889, £900. A loan of £8,400 has been obtained on the security of £30,000 B debentures.

Rapid Driving of a Cross-Cut.—A Tschebull, in a paper read before the Austrian Society of Engineers and Architects, describes the method which was employed in lignite mining near Gran in Hungary, in a case in which it was necessary to open up some lignite beds as rapidly as possible. Hand-boring was alone possible, and the question was how to proceed with the greatest rapidity in the driving, the formation being Eocene slaty sandstones and shale, and Triassic limestone. A shaft had been sunk to a depth of about 330 feet, and this had afterwards filled with water for about half its depth. A cross cut was then made, which commenced just above the water level, the progress made in Eocene rocks during the first month having been 159 feet. The author describes the arrangements made with a view to expedite the cross-cutting, the division of labour and the method of payment for work done. To enable the material brought down by the shots to be cleared away with greater rapidity, one or two flat pieces, of stout sheet-iron, about 6 1/2 ft. x 3 1/4 ft., were placed before the bore-holes previous to firing. Most of the rock brought down by the shots remained on these sheets, and was much more readily removed from them than would have been possible if the bed had consisted of the rough floor of the level. In the eight hours' shift the division of time was as follows:

Putting in the bore-holes.....	5 1/2 hours.
Charging and firing.....	1 " "
Allowing smoke to clear away.....	1/2-3/4 " "
Clearing the level, &c.....	3/4-1 1/2 " "

Leases for Mines of Gold, Silver, Coal, Iron, Copper, Lead, Tin — AND — PRECIOUS STONES.

Titles given direct from the Crown, Royalties & Rentals moderate

GOLD AND SILVER.

Under the provisions of chap. 7, Revised Statutes, of Mines and Minerals Licenses are issued for prospecting Gold and Silver for a term of six months, which can be extended by renewal for another six months. Mines of Gold and Silver are laid off in areas of 150 by 250 feet, any number of which up to one hundred can be included in one License, provided that the length of the block does not exceed twice its width. Up to five areas the cost is 50 cents per area, for every area in addition 25 cents. Cost of renewal one half the original fees. Leases of any number of areas are granted for a term of 21 years. These leases are forfeitable if not worked, but advantage can be taken of a recent Act by which on payment of 50 cents annually for each area contained in the lease it becomes non-forfeitable if the labor be not performed.

Licenses are issued to owners of quartz crushing mills who are required to pay Royalty on all the Gold they extract at the rate of two per cent. on smelted Gold valued at \$19.00 an ounce, and in smelted Gold valued at \$18.00 an ounce.

Applications for Licenses or Leases are receivable at the office of the Commissioner of Public Works and Mines each week day from 10 a.m. to 4 p.m., except Saturday, when the hours are from 10 to 1. Licenses are issued in the order of application according to priority. If a person discovers Gold in any part of the Province he may stake out the boundaries of the area he desires to obtain, and this gives him one week and twenty-four hours for every 15 miles from Halifax in which to make application at the Department for his ground.

MINES OTHER THAN GOLD AND SILVER.

Licenses to search for twelve months are issued, at a cost of twenty dollars, for Minerals other than Gold and Silver, out of which one square mile can be selected for mining under lease. These leases are for four renewable terms of twenty years each. The cost for the first year is fifty dollars, and an annual rental of thirty dollars secures each lease from liability to forfeiture for non-working.

All rentals are refunded if afterwards the areas are worked and pay royalties. All titles, transfers, etc., of minerals are registered by the Mines Department free of charge, and provision is made for lessees and licensees whereby they can acquire promptly either by arrangement with the owner or by arbitration all land required for their mining works.

The Government as a security for the payment of royalties makes the royalties first lien on the plant and fixtures of the mine.

The unusually generous conditions under which the Government of Nova Scotia grants its minerals have introduced many outside capitalists who have always stated that the Mining Laws of the Province were the best they had had experience of.

The royalties on the remaining minerals are :—Copper, four cents on every unit ; Lead, two cents upon every unit ; Iron, five cents on every ton ; Tin and Precious Stones, five per cent. ; Coal, 7½ cents on every ton sold.

The Gold district of the Province extends along its entire Atlantic coast and varies in width from 10 to 40 miles, and embraces an area of over three thousand miles, and is traversed by good roads and accessible at all points by water. Coal is known in the counties of Cumberland, Colchester, Pictou and Antigonish, and at numerous points in the island of Cape Breton. The ores of Iron, Copper, etc., are met at numerous points, and are being rapidly secured by miners and investors.

Copies of the Mining Law and any information can be had on application to

THE HON. C. E. CHURCH,

Commissioner Public Works and Mines,

HALIFAX,

NOVA SCOTIA.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 23, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one *per centum* of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

January, 1889.

NOTICE

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The Regulations also provide for the manner in which land may be acquired for milling purposes reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

**ONTARIO
Mining Regulations.**

The following summary of the principal
provisions of the General Mining Act of
the Province of Ontario is published for
the information of those interested in
mining matters in the Algoma District,
and that part of the Nipissing District
north of the Mattawan River, Lake Nipis-
sing and French River.

Any person or persons may explore for
mines or minerals on any Crown Lands
surveyed or unsurveyed, not marked or
staked out or occupied.

The price of all lands sold as mining
locations or as lots in surveyed townships
is two dollars per acre cash, the pine timber
being reserved to the Crown. Patentees
or those claiming under them may cut and
use such trees as may be necessary for
building, fencing or fuel, or for any other
purpose essential to the working of mines.

Mining locations in unsurveyed territory
shall be rectangular in shape, and the
bearings of the outlines thereof shall be due
north and south, and due east and west
astronomically, and such locations shall be
one of the following dimensions, viz: eighty
chains in length by forty chains in width,
containing 320 acres, or forty chains square;
containing 160 acres, or forty chains in
length by twenty chains in width, con-
taining 80 acres.

All such locations must be surveyed by
a Provincial Land Surveyor, and be con-
nected with some known point or boundary
at the cost of the applicant, who must file
with application surveyor's plan, field notes
and description of location applied for.

In all patents for mining locations a
reservation of five per cent. of the acreage
is made for roads.

Lands patented under the Mining Act
are free from all royalties or duties in re-
spect to any ores or minerals thereon, and
no reservation or exception of any mineral
is made in the patents.

Lands situated south of the Mattawan
River, Lake Nipissing and French River
are sold under the Mining Act at one
dollar per acre cash.

Affidavits showing no adverse occupa-
tion, improvement or claim should ac-
company applications to purchase.

A. S. HARDY,
Commissioner.
Department of Crown Lands, Toronto.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter with original bores of 3 and 3½ inches, bushings to be used for intermediate sizes; larger ones bored to order.

**WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,**

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.
22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to **THE DODGE WOOD SPLIT PULLEY CO., TORONTO.**

H. H. FULLER & CO.,
Halifax, N.S.

A Great Blast.—Recently at a quarry at Bethlehem, N.Y., 50 holes were bored to a depth of 30 feet, and these were charged with about 40 lbs. of dynamite each. The holes extended along the ledge for a distance of 350 feet. The amount of rock displaced by the blast is estimated at from 20,000 to 25,000 tons. Of course, in comparison with the Hell Gate blast in 1876 and the Flood Rock in 1885, this blast is insignificant. At the Flood Rock explosion, 240,000 pounds of rack-a-rock and 40,000 pounds of dynamite were fired, by far the greatest quantity of explosive ever used in one blast, and about 400,000 tons of rock were broken up.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

The Canadian Mining Review

CONDUCTED BY . . . R. T. A. BELL

OFFICES:

UNION CHAMBERS, 14 Metcalfe St.
OTTAWA.

Vol. VIII. SEPTEMBER, 1889. No. 9.

To Our Readers.

Owing to the press upon our space incidental to the recent Meeting in Canada of the American Institute of Mining Engineers, we have been compelled to hold over our usual notes from the mines, and other interesting matter.

Obituary.

We regret very much to have to record this month the sudden demise of Professor David Honeyman, Curator of the Nova Scotia Museum of Natural Science. The deceased gentleman will long be remembered as one of the greatest authorities on the Geology of eastern Nova Scotia and Cape Breton.

The sudden death of T. H. Hulbert, M.E., chief owner and manager of the Mink Mountain Mine, near Port Arthur, from an accidental overdose of morphia, takes from us one of the ablest pioneer explorers and mining engineers this district has ever seen.

The Visit of the American Institute of Mining Engineers.

The recent visit paid by the American Institute of Mining Engineers, and the holding of their autumn Session at the Capital was a feature of international courtesy amongst members of the mining profession which would well bear repetition, and the fruits of which cannot but be productive of immense advantage to Canada. When it was definitely ascertained early in the year that this visit was decided upon, a large citizens' committee was formed to take the necessary steps to carry out all requirements. This, however, soon resolved itself, as all such gatherings do, into a few energetic workers, to whom it became a "labour of love" to think out and arrange for the comfort of the coming guests, and to select what excursions would best enable them to see the mineral treasures of our country, and at the same time afford a pleasant trip in each of the provinces of Ontario and Quebec. Well did this committee carry out its work, and the voice of the visitors was unanimous in praise of everything done for them. The proceedings of the Session and the various excursions are described elsewhere. The number of our visitors was not so large as had been expected, but what was lacking in quantity was made up in quality, for those who came were all leading representative men at the head of their profession, and experts in every respect.

It is a matter of regret that only one representative of the iron trade, Mr. John Birkenbine, was in attendance. The slimness in the attendance of

this most important branch of the profession is however accounted for from the unusual activity now prevailing in the iron industry, and the largely increased number of blast furnaces now at work across the line; to the fact of the Paris Exhibition having induced a number of this class of the community to pay it a visit, while the lateness of the season and the inclemency of the weather prevented many more from attending who otherwise would have been present.

To this latter fact also is mainly due the abandonment of the proposed trip to the silver and iron districts of Port Arthur. The enterprising population of that rising town were disappointed, and rightly too, at the abandonment of that trip, for they had made the most elaborate arrangements for their expected visitors. To close this brief reference without mentioning the deep interest shown in everything by the ladies who accompanied a number of our American guests, would make it very incomplete, and their presence on the excursions, where despite the very bad weather prevailing they were the life and soul of the party, added materially to the success of the whole proceedings. We look forward with pleasure to another visit to Canada at some future day, of this distinguished body, the American Institute of Mining Engineers, and hope that what the visiting members have lately seen in their tour will tend to increase in every way the relationship which nature designed should always exist between the two nations of the North American continent.

Deep Gold Mining in Nova Scotia.

In the gold districts of Nova Scotia an auriferous quartz vein usually presents one or more irregular patches of ore richer than the quartz bounding it on the longitudinal extension of the lode. These rich "pay streaks or chimneys" vary in length and depth up to five hundred feet. They dip at various angles to the horizon, and do not materially differ from those found in other parts of the world. It is not necessary to allude here to the many ingenious theories which have been advanced to account for this concentration of gold, etc., at certain points in the vein, but it may safely be said that no law is known governing their formation in Nova Scotia, and the remark of an old miner best fits, that there would be no fun in gold mining without it.

As already remarked the shape of these pay-streaks is irregular, and they vary equally in their extent. Some outcrops of paystreaks have been followed but a short distance, while others have repaid the miner's toil to a depth of 600 feet, and others again have been struck accidentally in underground workings. Hitherto in Nova Scotia the life of a mine has usually ended when the paystreak gave out, the exceptions being the operations in slate belts, and in comparatively low grade veins, and it has become

a generally accepted axiom that there is no use in pushing explorations in barren quartz. A paper read at the last meeting of the Royal Society of Canada certainly gives reasons for expecting that the veins would thin out in depth, but it is also pointed out that the depth at which this thinning out may be met is far beyond the deepest mining yet reached here or in other countries.

In view of this abandonment of mining when the pay quartz in sight is extracted, the question of the enrichment of the veins at lower depths is of great importance to the Province as well as to the miner. Without the expression of an opinion as to the probability of the occurrence of rich paystreaks at greater depths, or the renewal of a paystreak, after an interval of barren quartz, on the line of prolongation of its greater axis, it may be remarked that, as the fact of lateral enrichment of a vein has been proved by the occurrence in it of more than one paystreak, there appears to be, in comparison with the limited extent of mining operations, no reason why similar enrichments should not be found in depth.

As yet no mining company in the Province has tried to prove this point, although its importance has been recognized by those who have been fortified by foreign experience, and the desire of securing the fullest possible return for the expense of purchase and equipment of their mines. Applications have been made to the Provincial Government to undertake the task, or to subsidise companies who might offer to carry out the test. The opinion of the applicants being that either a new shaft should be sunk in any district specially selected, or that in any district a shaft which had intersected a pay streak should be continued to a depth of from 800 to 1,000 feet.

The most apparent objection to the Government trying the experiment, either directly or indirectly, is that a failure in any district would be merely a negative proof, and would be quoted against the value of the deposits, and the consideration of experience would presumably not allow of this most admirable method of investigation being tried very often. In Australia large sums are annually expended by the Government in prospecting with diamond drills for the purpose of exploring for new gold fields. There, the conditions under which the gold occurs, as comparatively level deposits overlaid by immense masses of trap, etc., are favorable to this method of exploration. In Nova Scotia the alternating beds of slate and quartzite are inclined at high angles, the veins are numerous, and the work of boring would be extremely expensive, while the comparative narrowness of the veins would make a "test core" of a free gold vein, even if the drill penetrated a pay streak, of uncertain value.

A writer in a local paper some time ago suggested another way of approaching this matter, which is free from some of the objections

alluded to. The idea was that the Government should offer a bonus to the company which should first show practically the existence of gold in remunerative amounts at a depth exceeding, say nine hundred feet. If the chance of a good bonus was displayed, a company working quartz at a depth of 300 or 400 feet at a fair profit, could try the experiment without incurring a very heavy expenditure. If unsuccessful, the bonus would remain for another test, made perhaps in a different district, and under conditions possibly more favourable.

The Meeting of the American Institute of Mining Engineers at Ottawa.

The fifty-fifth meeting of the Institute was held at Ottawa during the week commencing Tuesday, 1st October. When the very large membership of the Institute is considered, numbering, as it does, close upon 2,500 members, a comparatively small attendance was registered when the first session was called to order. Many reasons may be given to account for this. As stated in our last issue, a large number of members had just returned from a European trip extending over several months, another considerable number were present at the Denver meeting in June, while others were present at the Toronto meeting of the American Association for the Advancement of Science and these, of course, found it difficult to get away again this year. Again, there has been a very decided revival of business in the United States, particularly in the iron trade, where blast furnaces are being blown-in, contracts are under negotiation, and engagements are more important and imperative than usual. The attendance of Canadian members was also not so large as expected. The following members of the Institute, and invited guests, were present during the meeting:—Dr. Chas. A. Asburner, Asst. State Geologist of Pennsylvania, and Mrs. Asburner, Pittsburg; S. E. Bretherton, Leadville, Colo.; Martin L. Griffin, Holyoke, Mass.; Dr. H. T. Bovey, Montreal; Capt. R. C. Adams, Managing Director Anglo-American Phosphate Co., Montreal; J. H. Bramwell, coal operator, Bramwell, Va.; C. S. Bedell, U. S. Assay Office, New York; B. T. A. Bell, editor CANADIAN MINING REVIEW, Ottawa; Dr. Robt. Bell, Geological Survey of Canada, Ottawa; John Birkinbine, M.E., editor *Journal of Chemical Workers*, Philadelphia; W. B. Cogswell, General Manager of the Solvay Process, and Miss Mabel Cogswell, Syracuse, N.Y.; J. B. Church, Mrs. Church, Miss DeLaney and Miss Bright, Geneva, N.Y.; W. S. DeCamp and Mrs. DeCamp, Lyons Falls, N.Y.; C. A. DeCamp and the Misses S. M. and M. A. DeCamp, Boonton, N.Y.; Prof. Thos. Egleston, School of Mines, New York; Dr. R. W. Ells, Geological Survey of Canada, Ottawa; T. R. Gne, President Acadia Powder Co., Halifax, N.S.; W. H. Hulick, Easton, Pa.; John E. Hardman, S. B. Oldham, N.S.; L. Holbrook, New York;

Wm. H. Hale, *Engineering and Mining Journal*, New York; Dr. B. J. Harrington, McGill University, Montreal; W. H. Hutcheson, Anglo-Continental Guano Works, London, Eng.; C. H. Joliet, Roselle, N.J.; Jas. E. Jopling, Marquette, Mich.; J. T. B. Ives, Toronto; E. D. Ingall, M.E., Geological Survey, Ottawa; C. Kirchoff, Jr., editor *Iron Age*, New York; J. S. Lane, M.E., M. C. Bullock Mfg. Co., Mrs. Lane and W. A. Lane, Chicago, Ill.; N. M. Langdon, Port Henry, N.Y.; A. P. Lowe, Geological Survey, Ottawa; Thos Macfarlane, F.R.S.C., Ottawa; F. H. Macdowall, Consulting Engineer, Tilley Foster Mine, New York; Major R. G. Leckie, Sherbrooke, Que.; A. N. Newell, Bradford, Pa.; J. Obalski, Mining Engineer to the Province of Quebec, Quebec; J. C. Platt, Waterford, N.Y.; F. Prince, General Manager Slate Mining Co., Slatington, Pa.; Dr. E. D. Peters, Jr., General Manager Canadian Copper Co., Sudbury; John C. F. Randolph, New York; Addison C. Rand, President Rand Drill Co., and Miss Josephine Rand, New York; Dr. R. W. Raymond, Montana Smelting Co. and Secretary to the Institute, Miss Elizabeth Raymond and Miss Atherton, New York; Theo. D. Rand, Philadelphia, Pa.; T. R. Redpath, Montreal; Prof. John C. Smock, Albany, N.Y.; Prof. S. Sharples, Boston, Mass.; T. Trimble, Managing Director Templeton and Blanche River Phos. Co., Montreal; J. Lainson-Wills, F.C.S., Buckingham; P. Würgbürger, M.E., Antwerp, Belgium, etc., etc.

Opening Session.

The opening session was held on Tuesday evening, 1st October, in the large room, House of Commons, usually occupied by the meetings of the Royal Society of Canada, and known as the Railway Committee Room. When proceedings commenced the hall was completely filled. Beside the members of the Institute, there were present a goodly sprinkling of local mining men and a large number of ladies.

Mr. B. T. A. Bell, Secretary of the Citizens' Committee, read letters regretting inability to be present from Sir Hector Langevin, Minister of Public Works; Hon. A. S. Hardy, Commissioner of Crown Lands, Toronto; Hon. G. Duhamel, Commissioner of Crown Lands, Quebec; and from His Worship the Mayor of Ottawa.

SHERIFF SWEETLAND—Mr. President, Ladies and Gentlemen of the Am. Inst. of M. E.: As Chairman of the Local Committee, it is my duty, and a very pleasing duty it is, to extend to you a hearty welcome to Ottawa. In doing this I speak on behalf of the citizens who appointed the gentlemen who act with me as the Local Reception Committee. We feel honored that you have made Ottawa your choice for this year's Autumn Meeting. I believe this is the third time that the Institute has met in Canada, and I trust that this may be reckoned hereafter as one of the most successful meetings ever held by the Institute. So far as the Committee and the people here are concerned we will endeavor to make it so. We have been assisted very materially by the liberal Grants from the Federal and Provincial Governments, so that the welcome is not confined to the city itself. The co-operation of the different governments is the best evidence that the country appreciates the position which you occupy as practical scientific men. I think I may use the word practical in connection with your Institute, because you are all workers as I understand it. You are all anxious to take from the bowels of the earth those economic minerals which are necessary to promote a higher civilization. We all work for that common purpose. It makes no difference whether we are on one side of the line or the other. I am glad to see that yours is an American Institute, that it covers the whole of this great continent. Although you meet sometimes in the south, sometimes in the extreme west, and at other times in the east, you occasionally pay a flying visit as you do now to the north. In Canada we have a very great deal to show you that I am satisfied will be of the greatest interest to yourselves, as well as, I hope, of interest and benefit to ourselves. The mineral resources of this vast country have as yet been scarcely touched. What little mining has been done has been but a tickling of the surface, but we have endeavored to show you by the series of excursions arranged for the latter part of this week that this northern portion of the American continent possesses vast and almost unlimited mineral wealth. We are going to take you over more

than 1,200 or 1,500 miles of our country and that is only a small portion of it, as you know, but it is as much as we can possibly show you on a flying visit such as this. I do not intend to, nor should I occupy your time this evening. I am merely supposed to extend to you a hearty and cordial welcome. I have on my right no less a personage than the Rt. Hon. Sir John A. Macdonald, a gentleman whom we in Canada look upon as being without a peer, and I think we are safe in saying so. (Cheers.) We have also a member of the Quebec Government, the Hon. Mr. Ross, Minister of Public Works, who comes from a Province which is deeply interested in the development of her mines. I will now introduce to you the Rt. Hon. Sir John A. Macdonald.

SIR JOHN A. MACDONALD—Gentlemen of the American Institute of Mining Engineers, I shall join as a citizen of Ottawa with my good friends in wishing you a hearty welcome. We are very proud indeed to know that your Institute has already honored Canada so far as to have visited it on previous occasions, and we hope your visit to our metropolis—which is still an infant metropolis of Canada—will be such as to induce you to come again. My remarks will be very brief, but they are not the less sincere on account of their brevity. We welcome you here. We are exceedingly proud and happy to greet you, and hope you will have a very pleasant time while you are here, and that pleasure may be joined to some acquisition of knowledge as to the resources of our country. Formerly, I am afraid, the majority of our American friends on the other side of the border considered us, as Voltaire considered Canada years ago, as occupying a region of ice and snow. I am glad to find that that idea has altogether disappeared, and some of my political friends going to the south of the border tell me, in fact, that the Americans are getting too affectionate. (Laughter.) They are getting altogether too affectionate. I dare say, and I hope and believe, that the intercourse between the people of Canada and you gentlemen, as representing a very important body from the United States, will tend still further to unite us together in feeling, as we are in blood and language and otherwise. I told a story a short time ago, which I shall repeat. It was a good many years ago now, when the Americans did not know Canada nor covet it so much as they do at present. (Laughter.) They were not so well aware of our very great merits. This story was told to me by a gentleman, now a Canadian but of American birth. He was traveling from Windsor, at the western extremity of Ontario, eastward, and he was sitting behind two American gentlemen who were evidently paying their first visit to Canada. He could not help hearing their conversation. After going a few miles eastward one of them said:—"This is not so bad a country." "No," says the other, "it is not a very bad country." After going a little further the one who had spoken first said:—"This is a fine country; we must have this country." "Oh," says the other, "I would have no objection to taking the country if it were not for the damned people we would have to take." (Laughter.) That is all gone now, and as I have already said, we believe that our good neighbors are beginning to think that our country is not so far inferior to theirs; not so far, at all events, as to disincite them to take the country even with the encumbrance of the people. (Laughter and applause.) I shall not detain you any longer, not being a miner myself, but a politician. Some of our enemies say of us that the only mining we know of is undermining. (Laughter.) But that is a falsehood, like many other falsehoods that are prevalent in this world. I wish every prosperity to your Institute, which I believe is calculated to do a great deal of good. I think science belongs to no country, nor does the practice of science belong to any country. I believe the examination of Canada by you, gentlemen, will be of very great service to Canada; and as a matter of self-interest, if it were not from higher sentiments, we greet you from the bottom of our hearts. We think, with your assistance, that is from the reports you will make, we will be able to stand still higher as a country capable of great development, and I can say that with your assistance we will be able to do that which is described in the rather profane language of the celebrated Sheridan when he went down to Manchester at the time of the construction of the great Bridgewater Canal. As you know, that is a great country for professional men like yourselves, and as far as canals and mines and the development of industries of every kind are concerned, that is a great centre. He was called upon to give a toast, and this was the toast—it is not profane, gentlemen: "Dam your rivers, sink your mines, and blast your canals." (Laughter and cheers.) With your assistance, and with the assistance of men like you, we hope to carry out these very objects. I greet you, gentlemen, with all my heart. (Cheers.)

SHERIFF SWEETLAND—I would ask the Hon. Mr. Ross, Minister of Public Works for the Province of Quebec, to address you.

HON. MR. ROSS—Mr. President, Ladies and Gentlemen: I have been present in this room before now, and I have witnessed some very severe bickerings and animosities on the subject of railways, but I must say I consider this meeting one of the most unanimous, as well as the most important, I have ever been at. There is no question whatever as to what Canada would be without railways; but on the other hand, what would Canada be if all the treasures that are buried under the surface of the earth were unknown? How could this country compete with other countries who have the advantage of experienced miners? Talking of experienced miners, I must not admit that we are inferior here in that material, nor in the ability of the few mining engineers we have. Some of them have world-wide fame. (Hear, hear). Nevertheless I think that such a gathering of able men as this is, from the different points of the continent must be doubly advantageous to themselves and a benefit, a great and lasting benefit, to us. The Province of Quebec is not at all blind to the advantages which follow from the visit of men who are not mere theorists, but who are practical men and who have already done great good to mankind, and will do still more. I recollect a tale of my childhood—for I was once a child—in which a magician enabled a certain princess to see all the veins of gold and silver hid in undeveloped portions of the globe by rubbing a certain ointment on her eyes. I say that mining engineers of the present generation can see as clearly through the earth as that princess ever could; but that ointment is not applied to their eyes, but to their brains, with hard study and comparisons of indications and results. There is no question whatever but that there are two magicians very helpful in this matter. These are geology and mineralogy—going hand in hand revealing the treasures of the earth, and to men who search for them their proper worth. I understand the Institute is based on a correct principle, by which practice is added to theory. Now, in the Province of Quebec the Premier, Mr. Mercier, is most anxious that the members of the Institute should call upon us, not as one of your generals called upon us several years ago, but as brothers. We extend a most cordial welcome to you. I might say that in asking this we are acting a little from selfish motives. It is to our immense advantage that these gentlemen come among us, as they may enable us to develop our resources. There is no doubt that the Province of Quebec and the other Provinces are very rich in minerals. As an instance I would refer to the extensive deposits of asbestos at Thetford and other portions of the eastern townships, which were unknown until a few years ago, and are now being worked and are yielding enormous profits. We extend a cordial welcome to you, and we shall be delighted to see you in the City of Quebec. (Cheers).

SHERIFF SWEETLAND—I have to regret the absence of His Worship the Mayor, but I am informed that Ald. Henderson, who is acting Mayor, is present. If he would be kind enough to say a few words on behalf of the City, we would like to hear him.

ALDERMAN HENDERSON—Ladies and gentlemen, I regret exceedingly that our friend His Worship the Mayor has found it necessary to be absent to-night. Otherwise I am sure he would be only too glad to have extended a cordial and hearty welcome to these distinguished gentlemen. I should like, however, to set my friend the Chairman right with regard to the remark which he made with respect to myself. I occupy no such honorable position as acting Mayor. I am simply an alderman in the City Council. When it was found that the Mayor could not attend I was asked to be present to say a few words of welcome to you. That I was delighted to do. I felt it would be a pleasant duty to welcome you, on behalf of the citizens of Ottawa, to this good city of ours. We are glad to have among us a number of gentlemen representing so large and influential a body as the American Institute of Mining Engineers. I trust you will find your stay among us not only pleasant but profitable. It is to be regretted that the weather is not promising well; but I hope that the warm welcome that will be accorded you, and the heartiness of your reception, will go far to neutralize that inconvenience. We welcome you for several reasons. First of all for your own sakes. We recognize the great work your Association has been doing the last twenty years. We recognize that amongst you there are gentlemen who are the highest eminence in the different branches of your profession, some of whom are of world-wide renown. We welcome you for your own sakes because we expect and hope to realise a large amount of pleasure from that social intercourse which we trust will take place between us. Again we welcome you because your visit will be of great and lasting benefit to this section of country. As Canadians we are naturally proud of our country. We look upon it as having a great future, not only in its intellectual advantages and material progress, but from the bounties of nature which are so liberally strewn around us. You have come to see for yourselves that on which we found those hopes of

material progress. Gold we do not possess in this section. Many of us slave for it, but so far it has not been taken from our mother earth in quantities sufficiently remunerative, but I think we can safely say we boast of ores, if not so intrinsically valuable as gold, which are calculated to build up a more prosperous nation than the possession of any gold mines could do. To those of you who are strangers among us—that is, who come from across the border—I desire specially to offer a cordial welcome. Strangers in one sense you may be, but in another sense you are not. We can all boast a common origin, a common language and a common mission—a mission to ennoble and assist our fellow men. Possibly in the near future there may be a closer link between us. Who can tell but what we may have a magician here to-night. We have one sitting at that table (referring to Sir John Macdonald), a gentleman who has been intimately associated with the progress of Canada—one who has seen it rise from a few scattered provinces and united and welded into this great Dominion. (Applause). It is just possible that some day he may think it time to have done with our eternal squabbles, about Commercial Union and Unrestricted Reciprocity, and think the time has arrived when he may extend his magic wand across the St. Lawrence and invite you to become part and parcel of our great Dominion. (Applause). There may be something enticing to have the stripes wiped out of your banner and have the stars encircled with a chaplet of leaves of the maple or the oak. If that does not tempt you I do not know what will. We can only trust that in the future we may live as we are doing now and have done in the past—to work together for one great end, to live in peace and good fellowship, to emulate one another's good deeds, seeking to extend the great principles of liberty, equality and fraternity. (Applause).

COL. LAV, Consul-General in Canada for the United States, briefly welcomed the Institute. An address was also presented from the Ottawa Board of Trade by the President, Mr. John M. Garland.

DR. THOMAS EGLESTON, New York—Mr. Chairman, Members of the Institute, Ladies and Gentlemen: It is my very great pleasure, in the absence of the President of the Institute, to accept on its behalf the hearty welcome you have given to the members of the Institute visiting Canada. We are not unknown to you. Many of us have very honored and intimate friends on this side of the border. We know your hospitality. Many of us have been here before, and we know exactly what we are going to receive in the way of hospitality and what we are going to see in the way of beauty in this fair land; for it is a fair land. I think I may say there is no 36 hours' railway journey in the West that equals the ride over the Canadian Pacific Railway; certainly there is no such scenery in the East. You have gold, silver, copper, coal of every kind, and you have it all in profusion, and all that remains is to get it out. It is going to come, and this fair land is going to be a very great as well as a very good land. It is not my duty as acting president to say more; but I call upon Dr. Raymond, who is Secretary of the Institute, to reply on its behalf.

DR. RAYMOND—Mr. President, Ladies and Gentlemen: I count myself fortunate to be designated to-night as one who may speak for his brethren of the Institute in reciprocation of the cordial welcome that they have received from their brothers and from the citizens of this goodly town. The brief glimpse that I have had in the few hours since my arrival, justifies me already in the conclusion that we may congratulate you upon being the inhabitants, and that we may felicitate ourselves upon being the visitors of this imperial city, and all this region in which the beauty and the wealth of nature have been appreciated by the intelligence, and developed and utilized by the enterprise of man. As I was looking over an exquisite collection of photographs in the rooms of the Local Committee, a collection which I hope, I betray no secret in saying our members are likely to become more familiar with before this meeting is past, I was struck by the casual remark dropped by my friend of the blue ribbon; possibly he thought it had no deep significance, but in my heart it struck a very profound chord. As I gazed upon a picture of lovely sylvan beauty, trees, flowing river, swift and bright cascades, he said, "That's what runs our mills." I know, gentlemen, that the fashionable poetry of the day scorns waterfalls that run mills, but to the mind of an engineer, and to the mind of a man of science, it is not beneath the dignity of a waterfall to run a mill. (Applause). A few of those here in this gathering went last summer into the far west, and among other things we visited a vast body of water that runs no mill—the Great Salt Lake, the Dead sea of the Interior, the incarnation of a type which I am glad to say is very rare in nature, the type of concentrated selfishness, receiving ever and giving never, and growing nastier and nastier all the time.

(Laughter and applause). No fish flash in its waters; where the gulls, for they have gulls over the Great Salt Lake, simply go through the motions of gulls over real water, and pretend to dive for fish where there are none, and when they have tired themselves in this exercise, fold their wings and tread along behind Mormon ploughs and hunt for bugs. (Laughter and applause). As we left that vast, bitter, useless lake, which is made perhaps to satisfy the æsthetic sense of some modern bard who thinks that nature ought not to be made useful, and we came eastward to other lakes—your lakes, my friends, and ours—which received freely and freely gave, out of whose crystal bosom runs such streams as the St. Lawrence, on whose great banks mighty forests wave and droop their pendant branches to the stream, great cities sit to lave their feet in the cool waters, the keels of commerce and the wheels of industry bless them and use them, and all down their course of a thousand miles they are swift with beauty and musical with life and instinct with power. (Cheers). But why, need I ask before a society of engineers, and the wives and daughters and sweethearts of engineers, that beauty need be divorced from us? (Cheers). Why need I ask that power must be idle? It is a slander upon Almighty God whose power in-dwelling inspires and operates the machinery of the universe. (Cheers). So I am glad to know that the waterfall which I saw to-day in the picture, and hope tomorrow to see with my own eyes, in fact runs your mills. I shall be glad to know that all the vast enginery of nature and all the hidden treasures of nature have been snatched—not snatched, but transferred into forms of beauty and of use, of higher use, for the bodies and the souls of men. (Applause). We have heard to-night from the Chairman of our Local Committee of a truth which has been somewhat ignored in higher quarters. I for one, let me say in passing, rejoice especially that we now meet again, as we have met on two delightful occasions before, beneath the banner of St. George and among the free subjects of that sovereign, who has often honored engineers, and whose long and prosperous reign will be in history most glorious as the age of great engineering achievements. (Cheers). Therefore, you will not suspect me of any irreverence or disrespect to that august lady if I criticise something in the speech from the throne, particularly because I do not suppose it was the lady, but the Prime Minister, and not the Prime Minister, but the clerk of the Prime Minister, who made some mistake in the speech—a speech in which the United States is spoken of as America, and the Queen herself, through the lips of her Minister, talked about her diplomatic relations with America. If she does not know better, she ought to. Canadians are as much Americans as we are. At least in the title of the Institute which meets here to-night, the word "American" was never intended to stop in its meaning with the St. Lawrence river, and we have given our proof of this many and many a time. In the first place, as Secretary of the Institute I collect the fees of the Canadian members just as rigidly and with just as much difficulty as from Americans. (Laughter). We take them in and we bounce them out with equal facility. Their obligations, their privileges, their rank is just the same as that of any man on our side of the line. In the second place, as though we would emphasise the continental character, or still better the cosmopolitan character of our association, we have at this time in the person of our President, Mr. Pierce, of Colorado, whose absence to-night I sincerely deplore and he sincerely deplores—a gentleman at the very fore and front of one of the branches which the Institute represents, a leading financier, inventor and administrator, and universally esteemed, and a subject of the Queen of Great Britain. (Cheers). Gentlemen, the Mining Engineers occupy a plane very high above politics.

SIR JOHN MACDONALD—Even at the bottom of the mines? (Laughter).

DR. RAYMOND—While statesmen are debating and enquiring, and perhaps intriguing concerning diplomatic or commercial relations, we have long ago established the closest of unions—the union of hearts in mutual esteem and the union of hands in common endeavor. (Hear, hear). For my part I would care nothing at all for any other union than that, and I care very little for any other union without that. If we can but remain without scism, secession or separation in the Institute of Mining Engineers, the North American Continent can behave just as it likes. (Laughter). And this union we shall maintain for the simple reason, apart from all joking on the subject, that it is a union so high that minor differences disappear. We stand under two flags, not alternately looking up to one and to the other, but honoring both always; because we are allied in the noblest of all warfare—the warfare of light against darkness, sunrise against midnight, of power against inertia, of mind against matter—and secure in the victory, in the continual, successive daily victories of this sublime warfare we look upon our nations' battle flag and see no longer the stains of human blood, but rather mingle the hues of a new heaven bending brightly over a new earth. (Cheers).

Sheriff Sweetland then vacated the chair in favor of Prof. Eggleston, Acting President, and the regular business of the Meeting was then begun. Prof. Smock read a biographical sketch of the late Dr. George A. Cook, State Geologist of New Jersey. He was followed by Dr. R. W. Raymond, who presented a similar notice of the late W. H. Seranton, of Oxford, N. J. With the aid of a few hastily gathered notes C. A. Ashburner, of Pittsburgh, paid a tribute to the late Capt. Wm. R. Jones, of the Edgar Thomson Works.

Wednesday.

Wednesday brought an additional number of members. The morning was given over to a drive to the celebrated Chaudiere Falls, and the great lumbering establishments to which they give life. The party was conducted through the large mills and factories of the E. B. Eddy Manufacturing Co., Messrs. Perley & Pattee, and other large industries. At Eddy's match factory and pulp mill the ingenious machinery was closely inspected and much admired. A visit was also paid to the Experimental Farm, where Mr. Fletcher, in the absence of Prof. Saunders, the Director, conducted the visitors to the various points of interest in, and around, this admirably conducted institution.

Afternoon Session.

THE QUEBEC GOLD FIELDS.

DR. ROBERT ELLS, of the Geological Survey of Canada, read an excellent paper on the "Mining Interests of Eastern Quebec," in which he dealt mainly with the copper, asbestos, gold, slate, and other mining work being carried on in the Eastern Townships of that Province. As we hope to be able to reproduce this paper in the REVIEW, no further mention of it will be necessary here.

MAJOR R. G. LECKIE—Dr. Ells has referred to the occurrence of gold in the Eastern Townships, and before leaving home Mr. Ives, M.P., and Mr. Pope, M.P., allowed me to take a bottle of the gold which had been gathered during the last year from the Ditton districts, (samples exhibited). This was washed from the bed of a small stream. I think it occurs within a width of one hundred feet. The rocks of that portion of the country have been described by Sir William Logan as Upper Silurian, but Dr. Ells by more recent observation classes them as Cambrian; perhaps Lower Cambrian. They are intersected by reticulating veins of quartz, perhaps running from six inches to one foot in width. At a distance of about two miles from where this gold has been gathered, a bunch of quartz was struck from which, perhaps, six hundred dollars worth of gold was abstracted, simply by hammering, without even a mortar. No further explorations have been made, and this gold has been collected by the crudest means; farmers going in there, after harvesting, and washing out the gold in a very premature sort of way. I think that within a year or so a systematic effort will be made to trace the source of the gold, and I am in great hopes that some very valuable leads of quartz will be exposed, which will form a source of great wealth to that part of the country. Dr. Ells has remarked that this same band of slates runs into New Hampshire, and this gold occurs within 20 miles of the line; so there is hopes for your part of the country as well.

DR. ELLS—I might say that for the encouragement of those who desire to investigate that district, that similar bottles of gold have been got within two miles of the line. They had a sluice running down a hill over fifty feet, and they shovelled it out with shovels and pitchforks. They did not get all the gold out you may be sure.

NATURAL GAS EXPLORATIONS ON THE ONTARIO PENINSULA.

DR. C. A. ASHBURNER, Pittsburgh, followed with a paper on Natural Gas Explorations on the Ontario Peninsula, in which he made the sweeping assertion that, in his opinion, gas would not be found on the Ontario Peninsula or in the valley of the St. Lawrence in sufficient quantities to allow of its being piped for a distance of ten miles. He thought that the possibility of finding gas in Canada was confined to the strip of land in that area, but he was disposed to question whether gas would ever be found in that peninsula to be transported in pipes of any considerable thickness for any great distance, although it might be of sufficient value to consumers in the immediate district.

DR. ELLS—I do not know anything about gas in Ontario. The gentleman who had charge of that is Mr. Coste, who left us last summer. I believe Mr. Coste has struck one well which has already furnished one million feet. That well is at Kingsville. He left the Geological Survey to take charge of it, so he must think there is something in it. I do not know whether it is to be piped or not.

DR. EGLESTON—I was told recently that gas in large quantities had been discovered on the line of the C. P. R. in the middle of the prairie. Where is it?

DR. ASHBURNER—It is in Alberta Province. I have been in correspondence with the people and would have made an examination had the bank account of my correspondent been sufficiently large. It is at Langevin station.

MR. MACFARLANE—When you come to talk of gas in that region it reminds me that about twenty years ago gas was discovered away down about seven hundred feet below the level of Lake Superior, in the Silver Islet mine; it is a fact that the miners there struck into gas, which was lit and burned for over a week at any rate. That is a well authenticated and recorded fact. The very interesting paper to which we have just listened shows that we should not be surprised at the occurrence of gas anywhere from the Devonian to those rocks of the St. Lawrence which are supposed to be the oldest Silurian rock we have. Here in Canada we have indications of gas but there may be varying compositions.

DR. ASHBURNER—There is very little difference in the composition of natural gas. The only difference is the quantity of sulphur it contains. It is almost all marsh gas.

A Member—That gas at Silver Islet might have been sulphuretted hydrogen.

MR. MACFARLANE—No; it was not sulphuretted hydrogen. It burned for a long time. The question is as to the origin of this gas. It is said that in boring down we come to certain strata that contain it, or certain porous strata which ought to contain it, and there it is in fissures or cavities; but having heard more or less of gas and petroleum in the last twenty years, it seems to me that there can be no other origin for either of these than coal. I think a very interesting discussion could be raised as to the origin of this gas. I should like very much indeed if Dr. Ashburner would give us his ideas on that subject.

DR. ASHBURNER—In answering Mr. Macfarlane's enquiry, I would simply say that the question of the origin of petroleum and natural gas has been most ably considered, more particularly by Prof. Leslie of the Geological Survey of Pennsylvania, and Dr. Newbury, the State Geologist of Ohio. There is no doubt that natural gas, resulting from the decomposition of vegetable or animal organism, has got into the rocks. We know that coal results from organisms principally vegetable, but I do not think we have any authentic case where petroleum or natural gas has been derived from coal. There is not much to show that petroleum or natural gas has any relation to coal. It was thought for fifty years after the development of the Pennsylvania oil fields that there was some connection between the oil and the bituminous deposits in the hills; but that was merely coincident that coal and oil were found in the same district. Now we get gas in northern Ohio absolutely disconnected from any coal fields, and we get petroleum in the vicinity of Florence, Colorado, where there is absolutely no oil. It thus seems that this gas and coal occur independently. All this indicates independent geological relationship.

DR. RAYMOND—In further reply to Mr. Macfarlane, I would remind members that the subject of the origin of petroleum, and of natural gas incidentally, has been very well summed up and argued upon the basis not only of American conditions, but also upon the conditions in Russia, the Crimea and elsewhere by Professor Herrfort, one of the honored members of this Institute, in his recent volume on oil, constituting one of the numbers of a botanical dictionary in process of publication in Germany. Professor Herrfort maintains, if my recollection serves me, that the sole source of true petroleum and natural gas is animal remains, and he supports that theory by reference to actual synthetic experiments, by which lards and similar animal fats have actually been transformed essentially into petroleum by proper treatment and temperature and pressure. It is an interesting summary, and I think he substantially takes the same view as Prof. Leslie and Dr. Newbury. If that be the case, we can scarcely say that coal and petroleum have the same origin, as coal is not of animal origin.

DR. ASHBURNER—In further reference to Dr. Herrfort's work, to which Dr. Raymond has referred, I would say that the argument which he advances—and I was in correspondence with him for two years,—and which he supports with most conclusive evidence, or facts, or facts gathered from experiments, is very well grounded, although not absolutely an original idea. It has gained considerable ground in America and animal organism has been acknowledged as being the basis of some of our petroleum. Dr. Chandler has referred to

this matter and has done some considerable work with respect to it; and Prof. Peekham in his work on the exploration of the California oil fields, from chemical and microscopic examination of those oils, points out the difference between the eastern oils and the California oil and showed that the latter were no doubt derived from vegetable organism. When it comes to our eastern hydro-carbons, liquid as well as gaseous hydro-carbons, we feel we are able to assert with a good deal of positiveness that the petroleum which we get in the carboniferous state, and we get a good deal of the carboniferous in Pennsylvania, some largely from vegetable, but to some extent from animal; whereas the gases or petroleum of the lower Silurian are to a great extent from the decomposition of animal remains. In California the oils were probably entirely animal in their origin.

MR. MACFARLANE—I desire to say that I have read the work of Prof. Herrfort to which Dr. Raymond has referred, and also Prof. Shedler in his recent work on oils and I am aware that the origin of these oils was attributed to animal matter. Of course, in the face of the authorities quoted I have not much to say on the subject, except to mention that the quantity of animal matter when you regard the large amount of petroleum and gas that has been produced could have been sufficient. I would further mention the fact that there does not occur in these petroleum or oils the element nitrogen to the extent that one would expect if the origin had been of an animal nature. Before resuming my seat I would like to mention that there have been some important occurrences of gas in Ontario. There was a very important well set on fire somewhere; we read about it in the newspapers as having been a very extraordinary occurrence, and the flow of gas from that well must have been very great indeed. It is a matter of regret that we have no Canadian authorities at present who are able to give this Institute any information on this subject. I think it is something we ought to be ashamed of.

DR. ASHBURNER—The gas from the Fredonia, N.Y. region contains nine per cent. of nitrogen, and quite a number of our cases do contain nitrogen.

MR. MACFARLANE—That is nitrogen in the state of gas, and that might have been derived from other sources.

DR. RAYMOND—You do not mean nitrogen of mere air mixed with gas?

DR. ASHBURNER—I mean nitrogen as part of the gas compound nitrogen.

MR. MACFARLANE—In what form does it occur if compound?

DR. ASHBURNER—I cannot speak of that, but it has been a question whether there is ammonia or not. Several analysis of the Fredonia gas show ammonia, but I have been disposed to question whether it was ammonia.

MAJOR LECKIE—I remember a discussion between Dr. Newbury and Professor Sterry Hunt sixteen years ago, and Dr. Newbury took the ground that these oils and gases were derived from bituminous shales. Dr. Sterry Hunt maintained, on the other hand, that these oils resulted from the decomposition of marine life and was to be found in the limestone of marine region. I think there is a good deal in what my friend Mr. Macfarlane says about the connection between oil and coal and carboniferous formation. What has become of the immense quantities of volatile matter given off in the change of bituminous coal into anthracite? How many millions of tons of volatile matter must have been given off.

DR. ASHBURNER—We never find gas in the vicinity of Anthracite.

MAJOR LECKIE—It may have been carried off and held in reservoirs. From the fact that Professor Eggleston mentions that of gas is found at Langevin near the base of the Rocky Mountains is important. You come there to where the bituminous coal is being converted into anthracite. I do not see it is at all unreasonable to suppose that the immense volumes, amounting to millions and millions of tons of volatile matter, which have been given off are bottled up somewhere. If not where has it gone?

MR. MACFARLANE—There are not only the volatile products that come from the bituminous coal to be accounted for, but there are also the products from the change of vegetable matter into coal. What we have also to account for is where the products of that change have gone. I mean the products of the change of peat, we will say, or vegetable matter as it originally was, to the coal. There must have been a very large amount of volatile matter produced, and it is quite

reasonable to suppose that this may have been held in reservoirs under continuous pressure.

DR. ASHBURNER—I think Mr. Macfarlane's and Mr. Leckie's views are undoubtedly correct if they will expand them into the theories and explanations so carefully described by Prof. Leslie and Dr. Newbury. There is no rock that is absolutely free from coal. You can find coal absolutely in every rock formation; but commercial coals are confined to a distinct formation. I think Sir William Logan pointed out the occurrence of carboniferous material in the Laurentian rocks of Canada, but the formation of oil, gas and coal, is practically in the same sequence or comes in the same category of phenomena.

MR. INGALL—There was an attempt made to collect some of the gas at Silver Islet, but we never happened to be around when the flow occurred.

PROF. SMOCK—I should like to ask Ashburner if there has not been natural gas found in sufficient quantities for commercial purposes in the Trenton limestone in Lewis County, N.J. The papers report the fact.

DR. ASHBURNER—That is immediately west of the Adirondacks; there had been quite a number of finds. Since my paper of two years ago in which I referred to this there have been several, but I have not known of them in commercial quantities. I know of no locality east of Fulton, N.J. As to the possibility of finding it in the lower part of New York State, I think it is not encouraging, because it does not look as if the rocks were sufficiently free from cracks to prevent the gas from escaping.

PROF. SMOCK—I should not expect it, but the newspaper reports from time to time have said so.

PROF. EGLESTON—What towns have they been found in?

DR. ASHBURNER—I do not just recollect. It is just west or south-west of the outcrop of Trenton limestone and in the Hudson River district.

The Institute then adjourned until two o'clock the following afternoon.

RECEPTION AT THE RUSSELL HOUSE.

It was at first proposed to tender the visitors a public Reception in the Senate Chamber, but the Government having negatived the proposal, the idea was abandoned in favor of a smaller affair in the Russell House. This proved a decided success, very many of our representative citizens turning out to spend an hour or two with the visitors. Lady Macdonald along with the lady friends of the local committee received the guests in the Ladies' Parlor. The string band of the Governor General's Foot Guards furnished music, and dancing was heartily indulged in up to a late hour.

Thursday.

Thursday, like its predecessor, proved wet and miserable, indeed during the early morning a considerable quantity of snow fell. Parties were, however, conveyed in the forenoon to the Geological Survey Museum, the Parliamentary Library, the Senate, House of Commons, the works of the Canadian Granite Co., and other points of interest. The Geological Survey Museum was pronounced most complete, well arranged, and a credit to the country, but the limited space at the disposal of the Director was not commented upon in so favorable terms. The visitors were delighted with the Parliamentary Library, and the handsome appointments of the various public buildings.

Afternoon Session.

NOVA SCOTIA IRON ORES.

MR. B. T. A. BELL, read a paper on the Geological Relations of the Nova Scotia Minerals, written for the meeting by Mr. E. Gilpin, Jr., Deputy Commissioner of Mines, Halifax. As the paper will be published in full at a later date, details are withheld.

DR. C. A. ASHBURNER—It was not my privilege to read the latter part of this paper, but I will make a suggestion which the secretary can carry out in correspondence. It would be interesting if Mr. Gilpin could extend his paper to the extent of referring to the geological relationship, more particularly of the iron ores of Nova Scotia and Cape Breton. Several years ago my attention was directed to the iron ores of the eastern shore by some iron masters of Pennsylvania, with the view of mining those ores and importing them into the States. At that time, with Mr. Gilpin's assistance, I collected a large mass of material, but the Pennsylvania people did not invest in the enterprise. It seems to me that if the attention of iron men could be directed to the

possibility of finding large deposits on the eastern shore there would be a great commercial demand for them, particularly the ores along the eastern shore, along the Bay of Fundy, and more particularly in the vicinity of Digby Bay. I think it would be a very acceptable thing, not only to the members of the Institute, but to a great many of our commercial iron men in the States, if this paper could be elaborated to treat, not only of the geological relationship of iron ores of the eastern shore, but to give some suggestions as to the possibility of our obtaining ore for consumption in the States—iron ores sufficiently low in phosphorus and high in iron to compete with the ores in Pennsylvania.

PROF. EGLESTON—I would like to add my request that this be done. I had occasion during the morning to look over iron ore in the museum, and I was astonished that such large quantities are found low in phosphorus and high in iron. The iron men of the States would be very glad to get it, if members of the Institute would only let the character of the ore be known.

MR. J. C. PLATT—I would also ask Mr. Gilpin to bring out the question of titanic acid in these ores.

SILVER ORES OF THE PORT ARTHUR DISTRICT.

MR. E. D. INGALL next occupied the attention of the meeting with a talk upon the Silver Ores of the Port Arthur District, which was illustrated with drawings and slides exhibited by lantern. The paper was followed by some appropriate remarks by Mr. Thos. Macfarlane, who as everyone knows, was one of the first discoverers of the famous Silver Islet mine.

GOLD MINING IN NOVA SCOTIA.

MR. JOHN E. HARDMAN, Oldham, N.S., followed gave a most interesting address on the "Methods of Gold Mining in Nova Scotia." As the paper, like Mr. Ingall's, will be supplemented with more data before publication, we regret to be unable to reproduce it now.

MAJOR R. G. LECKIE exhibited a number of very nice samples of gold from the Montague mine, Nova Scotia, the largest piece of which, he said had been carefully weighed and valued at \$1,100. For two years or more, on account of differences among the shareholders, the mine remained idle, but ultimately the ownership had passed into the hands of Mr. Charles Annand, of Halifax. The vein runs from eight inches to two feet in width and has been opened for a length of 600 feet. In this distance there are three streaks of rich quartz, dipping at an angle of 20°. Further east at 170 feet the second streak was struck, 80 feet from the surface. The third from which the specimen exhibited came, about 500 feet from the first, was struck at a depth of 100 feet from the surface. The deepest point yet reached is only 175 feet. The large piece carries considerable gold, and shows the width of the vein where it becomes rich. The smaller piece shows sulphides of copper, lead and zinc associated. These are characteristic of the richest veins in the Montague district. Arsenical pyrites is found in specs and nodules in the foot-wall, some of which are very rich in gold. In the vein itself a peculiar feature is the regular occurrence of arsenical pyrites carrying little or no gold. From 30 tons of quartz crushed last month, 174 ounces of retorted gold were obtained, exclusive of what passed away with the tailings. In addition to this, 100 ounces are locked away in the mill, and we have before us now 130 ounces in these specimens. Altogether, therefore, over 400 ounces were carried in the 30 to 31 tons of quartz raised last month. When the vein reaches its maximum thickness of two feet it becomes impoverished and yields only 6 to 7 dwts. per ton.

DR. RAYMOND—Did they treat that arsenical pyrites by itself?

MAJOR LECKIE—It is saved now in the tailings. That which is on the foot-wall is rich in gold, but the pyrites found in this vein overlying this gold is very poor.

PROF. EGLESTON—The mispickel?

MAJOR LECKIE—Yes; but when you get these nodules or mispickel off the foot-wall—that is outside of the quartz—they carry considerable quantities of gold. You can break the mispickel, and you find it held together by gold. I might say that from 30 tons of quartz crushed last month 100 ounces of gold were retorted. We have some 130 ounces here in these specimens, and altogether over 400 ounces were carried in the 30 or 31 tons raised last month. When the vein reaches the maximum it yields but six to seven dwts. per ton.

DR. RAYMOND—Would that pay?

MAJOR LECKIE—Yes; with the facilities we have for water power, and considering the high character of the gold. It is worth from \$19.50 to \$20 per ounce.

PROF. EGLESTON—You do nothing there more than direct Amalgamation.

MAJOR LECKIE—No; not to my knowledge. We are not working tailings. There is no abstraction of gold by chemical methods.

MR. JOHN E. HARDMAN—There is no attempt at working the sulphides on any scale; nor is there any attempt at Concentration.

MAJOR LECKIE—There is natural Concentration.

MR. HARDMAN—In the majority of cases they are sluiced away and pass into the sea.

PROF. EGLESTON—I was going to tell about a mill in California where they made Concentrations up to \$300, but I do not suppose my story is good for anything.

DR. PETERS—I had heard a good deal about the Nova Scotia gold mines, and I thought from the statements made that that was just the place I was looking for, but I found them just about as sharp men as you find anywhere. If any mill man went down there under the supposition that he was going to show the natives anything he would be mistaken.

PROF. EGLESTON—Some years ago in Nova Scotia there was a chlorinating mill, and they sent more gold up the chimney than they recovered. They used too much salt. I should like to know where that mill was.

MR. HARDMAN—I have only been there four years, and I have not heard of any attempt at chlorination there.

PROF. EGLESTON—This was chlorination very similar to that I saw in California. They either covered the gold with oxide, or they sent it up the chimney as chloride.

MAJOR LECKIE—The only chlorination I know of was at Capelon, and was done by Henderson Bros.

PROF. EGLESTON—Did they have Longmead?

MAJOR LECKIE—That was the origin of all these methods—using iodide of potassium.

PROF. EGLESTON—They used to use iodide of zinc.

A paper on the subject of fine and float gold by Prof. Egleson, in which Dr. Peters, Dr. Raymond and others took part, terminated the session, which adjourned until 8 o'clock in the evening.

EVENING SESSION.

DR. E. D. PETERS, Jr., general manager of the Canadian Copper Company, opened the meeting with a graphic and most interesting description of the mines and works of his company at Sudbury. This was undoubtedly the most important paper of the meeting. A verbatim report of the paper and the subsequent discussion upon it is given our readers in another portion of this issue.

DISCUSSION ON CANADIAN PHOSPHATE.

DR. ROBERT BELL, of the Geological Survey of Canada, introduced the subject of the Phosphate Deposits of Ottawa County in a brief address, in which he dwelt specially upon the geological relations of these deposits, illustrating his remarks by some excellent crayon and water-color drawings.

MR. J. LAINSON-WILLS, Buckingham, followed with some remarks on the associated minerals found in connection with phosphate, and pointed out that while the occurrence of the mineral might be irregular, there was one point of regularity, namely, that of the continuity of the formation over a large extent of country.

CAPT. R. C. ADAMS, Montreal—I have been asked to say a few words on the practical side of the phosphate business to supplement the interesting scientific statements you have just heard. If the hour was not so late I might have been much pleased to say a good deal on this subject; but I hardly like to trespass on your time to the extent I might do. I will therefore merely allude to a few points. You have heard in graphic scientific language from Dr. Bell how irregular these deposits are, and you have seen from his diagrams their peculiar nature; that they are here and there and everywhere, and not as often everywhere as we would like. When this industry was started, you may know, it was carried on by farmers. In their spare time they picked at this little outcrop of phosphate or that which occurred on their farms. One of these was asked what he thought of phosphate occurrences, and he gave this description:

"It is long and it is short; it is wide and it is narrow; it is deep and it is shallow; it is thick and it is thin; it is here and it is there; you have got it and you haven't got it; you see it and you don't see it." Then he used some terms which are technical. He wound up by saying: "It is — of the — and I won't have a — thing to do with it." (Laughter.) That expressed in forcible terms his opinion of the mode of occurrence of apatite. The occurrences differ in the two sections where it is mined — in the Ottawa District and the district between Perth and Kingston. In the Ottawa region it occurs more in masses through the rock; whereas in the Kingston district it is found in distinct veins. They are smaller in size than those found in the Ottawa district and this has led to different methods of mining in the respective districts. In the Ottawa district the steam drill comes in very well and large masses can be blown down and the phosphate separated. While in the western district it is not so appropriate to use the drill, as I have found to my cost. I have squandered a good deal of substance in riotous rock drilling. I thought I would depart from the old system, which Mr. Hardman has described as the flour-barrel-and-windlass system prevailing in Nova Scotia. I got an Ingersoll Compressor, but on using it found we had to break so much rock that the work became too expensive, and that it was cheaper to work by hand. The scientific phases have been described by Dr. Bell and Mr. Wills, and although you might think the commercial side does not bear on your sphere, it certainly does so, inasmuch as your reward depends on it. Some of the troubles we have had to encounter in the commercial field have hindered our enterprise here. With regard to ordinary mining we certainly want your assistance. Things have been done heretofore in these mines without the assistance of science, and we wish we had some men like Dr. Peters to apply a little thought and brains in developing the best methods of working the mines. I know that mining engineers never believe anything favorable that is said with regard to mines, and they do not always believe what they see, and you will still believe that as we raise phosphate there are some advantages that we modestly refrain from mentioning. The commercial points are these: When this phosphate is shipped we sell it at what we think is a good price. The first thing we discover is that there is a discount of $2\frac{1}{2}$ per cent. That comes off. Then it is sent over to the other side under a guarantee that it is to go a certain percentage. This is determined there in samples as the stuff is discharged, and it is a contest of wits and chicanery between the two parties. The buyer's agent and the seller's agent have the drawing of these samples. The buyer's man has the most experience because he receives large quantities, while the seller's agent may handle but a few cargoes in a season. The buyer's man is the most skilful. These two samples are sent to different chemists and the astounding fact is presented that the buyer's chemist is generally lower than the seller's. In an entire season's shipments, seven out of eight, the buyer's chemists would be lower than the seller's, and in some cases as much as three and a half per cent. I have seen as high as 3.57 difference, and another 2.52. This is a problem between mind and matter which is overwhelming. When you remember that our success depends upon the correspondence of the analysis with the guarantee, you see how great is the uncertainty where there is a possibility of 3.5 variation between the buyer's and the seller's chemist. If the cargo is rejected we get into a great deal of trouble. It is taken off by the buyer into his works before the quality is determined. If it goes $\frac{1}{2}$ or 1% below the guarantee it is rejected, and we are told they cannot use such worthless stuff. To take it away involves great loss. I know of a shipment this summer which was rejected only $1\frac{1}{2}$ % below the guarantee. I know of another reduction of £1 10s. where a fall of two per cent. took place. I think it is a mistake to have the article pass into the buyer's control before its value is determined, but it is a problem how to remedy this. I will not detain you by going into other points in this direction; but I want to say one thing with regard to the future of Canadian phosphate, and I hope the chemists among you will give it attention. That is with regard to crude phosphate. Many believe it to be valuable in its raw state. We have good authority for saying that superphosphate reverts and becomes to some extent insoluble, and if phosphate be ground fine it may be that in being acted upon by the carbonic acid of the soil, or juices of plants, renders it available for plant food. I have seen remarkable results from it. I went into a barnyard where they had used this Canadian phosphate for years and I saw some beans which reminded me of an advertisement in Boston. One man who was very corpulent was represented as saying: "I dine at Blank's while the other, lean and cadaverous, replies, 'I do not.'" These phosphate beans were immense fellows, climbing to the top of the poles, while those which had not been so fed were miserable little things. In this case it was combined with suitable manure, which perhaps occasioned some fermentation, and in that way made the phosphoric acid available. We feel that if this

fact is established it will be of immense benefit to our industry and to the progress of Canadian agriculture. (Applause.)

MR. P. WURZBURGER, Antwerp, followed with a few remarks in which he expressed himself as most favorably impressed with the great future of the phosphate industry in Canada, judging by the progress being made in the development of the mines which he had visited.

MR. W. H. HUTCHINSON, London, Eng.—In coming here I came more as a listener than intending to speak, but as I have heard a few words on the commercial side of the question I may reply to some of them. I represent a firm of fertilizer manufacturers in London, England, of some importance, and buy large quantities of phosphate. This is the first time that I have heard of any great difficulty on the other side. We buy very large quantities of South Carolina phosphates as well as Belgian and French phosphates. They are taken to our works and sampled by our chemist. The sample of the seller goes to another chemist, and they usually agree. The only time we have difficulty is when foreign chemists come in, who have slightly different methods of determining the phosphoric acid. Then differences do occur; but with the chemists in England there should be no difficulty at all; certainly not more than one per cent. I think if you take a good respectable chemist, such as those of the Royal Agricultural Society, and others of world-wide fame, there should be no question of *mal fides* as there is in this case. The Canadian phosphate mines supply about 20,000 tons annually to England, whereas we import from South Carolina, France and Belgium from 270,000 to 300,000 tons. So you see what we get from here is quite immaterial. Still the phosphates that come from Canada are highly appreciated, and I think the industry has a great future. The only thing is to remember this: The farmers in Great Britain are many of them very poor, and we have to sell to them at very low prices. We must, therefore, buy on the best terms, and unless the Canadian phosphates are sold as those of South Carolina and other countries it cannot find a place in the English market. We must bear that in mind. I wish the industry here every success. I have been here now about a fortnight, and everywhere I have been received with a great deal of hospitality. I have been afforded every facility for looking through the mines, and I can only express my thanks to everybody for the way in which I have been received.

MR. H. B. SMALL, Ottawa—The Minister of Agriculture, the Hon. Mr. Carling, has during the past few years given particular attention to this question of the utility of crude phosphates as a fertilizing agent, and has asked the directors of the Government Experimental Farms to make tests with highly pulverized phosphates with the object of ascertaining what results might be expected from various crops. These experiments have been in progress over two years, but the actual results are not yet known. Some of them will probably be tabulated and laid before the House during the next session of Parliament. Experiments made by private individuals in this locality have been rewarded with a good deal of success. As Captain Adams has said, if highly pulverized phosphate be mixed with other suitable manure, such as that known as black or swamp muck, containing a higher percentage of acid than ordinary soil, good results are more quickly produced. Pulverized phosphate by itself would probably take years to produce a good effect, whereas when mixed with suitable manure, or soil having acid in it, results are had in a short time. I understand that Capt. Henwood, of the Emerald mine, has used fine ground phosphate with very great success. Last year some potatoes were brought to my notice which had been grown near Buckingham. Half the patch had been sown pretty thickly with pulverized phosphate, and the other half with ordinary stable manure. The potatoes where the phosphate had been put were much larger than the others, and perfectly clean, while the others were scrubby. I believe myself that crude phosphate in a pulverized state will come to be very largely used by our agriculturalists in combination with stable manure.

PROF. EGLESTON—I wish to say that some years ago I had occasion to make some experiments respecting the action of felspar on the soil. I commenced with orthoclase, and ground it from the size of a pea to the fineness of flour. The effect it had was almost like guano. Experiments have recently been made with regard to the action of organic acids on soils and rocks, and I believe these experiments show that organic acids act more powerfully than mineral acids. If the phosphate is ground fine enough, it does seem that if felspar would act in this way phosphate would behave in a similar manner.

The hour being late it was reluctantly decided to have Mr. John Birkenbine's paper, "The Possibilities of the

Manufacture of Iron at Ottawa," read by title. The other papers submitted to the meeting which were not read, but which will appear in the Transactions are: Gold Quartz, by W. M. Curtis, Detroit, Mich.; Notes on Some Coals in Western Canada, by W. Hamilton-Merritt, A.R.S.M., Toronto; Stamp Mills, by John Hayes Hammond, San Francisco, Cal.; Ventilation, Progress and Cost of the New Croton Aqueduct, by J. P. Carson, Dobbs Ferry, N.Y.; The Wear of Rails as Related to their Section, by P. H. Dudley, N.Y.; The Columbia Iron and Steel Works, Pittsburgh, Pa., by G. W. Maynard, New York; The Physical Properties of Aluminum, and Comparison of it with other metals, by W. J. Keep, Detroit, Mich.; Phosphorus in Cast-Iron, by W. J. Keep, Detroit, Mich.; The Davis-Colby Roasting-Kiln, by S. G. Valentine, Lebanon, Pa.; Commercial Economy, by Dr. R. W. Raymond, New York; Remarks on the Metallurgy of the Tellurides, by Frank Clevis Smith, Ann Arbor, Mich.; The Huanita Mining District, State of Morales, Mexico, by G. W. Maynard, New York.

This terminated the business of the Meeting.

Friday.

EXCURSION TO THE PHOSPHATE MINES.

The members of the Institute, accompanied by a number of prominent citizens, in all about 100 ladies and gentlemen, paid a visit on Friday to some of the phosphate mines on the Lievres river. Early in the morning the party was conveyed by special train to Buckingham, where the steamers *Agnes* and *High Rock*, with a large scow specially fitted up for the accommodation of the party, were found in readiness to take them to the mines. Despite the bleak, bitterly cold weather which prevailed, the sail up the picturesque river was greatly enjoyed, and many were the expressions of delight at the charming scenery decked out on every hand in all the gorgeous splendour and varied hue of its autumn tints.

At the Little Rapids, twelve miles from Buckingham, the mines now being developed by Mr. W. A. Allan, of Ottawa, were first visited. Many of the party descended the shaft and closely examined the various levels at which large masses of rich green phosphate are prominently exposed. After inspecting the engine house, cobbing machinery, and the other plant and buildings, a return was made to the Landing, where a large marquee had been erected, and an excellent lunch was served. A number afterwards took the steamer and ran down to the Emerald mines, operated by the Ottawa Mining Co., where Capt. Henwood, the genial superintendent of the mines, received and escorted them through the various workings of this old and richly productive property. Others spent an hour examining the large lock and dam in course of construction by the Government contractors, the Messrs. Poupore. Here several of the ladies greatly enjoyed a run down the rapids in a canoe.

The return journey was beguiled with dancing, tug-of-war and all manner of diversion and entertainment. At Buckingham the good ladies of that hospitable little village had thoughtfully provided steaming hot coffee and other refreshments which were most heartily enjoyed after the somewhat cold experience of the river. Ottawa was reached a little after eight o'clock. Special thanks for the thorough success of this excursion are due to the mine owners and managers at Buckingham, and particularly to Mr. J. Keith Reid, whose untiring efforts to promote the enjoyment of everyone cannot be too fully appreciated.

EXCURSION TO SUDBURY.

The following members took advantage of the excursion to Sudbury leaving Ottawa by the midnight express: Messrs. F. Macdowall, Dr. R. W. Raymond, Professor Sharples, M. N. Langdon, C. A. De Camp, A. W. Newell, Major R. G. Leckie, L. Holbrook, Thos. Macfarlane, J. T. B. Ives, Dr. E. D. Peters, Lieut.-Col. Anderson, C. E., and Dr. Robert Bell. As the majority of these were most desirous of participating in the series of excursions arranged for the following week through the Province of Quebec, only some five hours were spent at the mines and works at Sudbury, but under the able guidance of Dr. Peters this proved amply sufficient to give the visitors a thoroughly good impression of the nature and extent of the copper, and particularly of the rich nickeliferous deposits being so extensively operated by the Canadian Copper Co., the Dominion Mineral Co., and other concerns in operation there. By making close connection with the returning trains, the party was enabled to join the other members at Montreal on Sunday evening, in time to join them on their trip to the Eastern Townships. It was most unfortunate, and none regret it more than the Local Committee at Ottawa, that the elaborate programme arranged for the

EXCURSION TO PORT ARTHUR AND DISTRICT

had most reluctantly to be abandoned at the last moment. It should be stated that when Mr. Bell, Secretary to the Committee, submitted the plan of the proposed excursions to the Council of the Institute, Dr. Raymond

replied that the greater number of those visiting Canada had signified their intention of taking advantage of this trip to the Port Arthur silver mines. The people of Port Arthur nobly responded to the invitation from the Ottawa Committee to welcome them and went to a great deal of trouble in arranging the following elaborate and complete programme for their reception and entertainment:—On Monday, October 7th, the party was to arrive and be met at the station by the members of the committee, who were to accompany them to the mines, proceeding by train to Murillo, where, at 4 p.m., conveyances would be in waiting to carry the party to the mines. The Beaver would be reached at 6 p.m. That night would be spent at the hotel. Tuesday would be devoted to a minute inspection of the Beaver, Badger, Elgin, Porcupine and adjacent mines and silver mills. Wednesday morning would be given to the journey from the Beaver to Silver Mountain, the afternoon and Thursday morning to the Shuniah Weachu, West End and Crown Point mines. A detachment could visit the Whitefish Lake group or the Mink Mountain, Silver Fox, Silver Glance, Wolverine and Queen mines. Thursday afternoon the homeward journey would be commenced, spending another night at the Beaver. Friday morning the party would drive to the Kakabeka Falls, where an informal luncheon would be prepared, and Port Arthur would be reached at 4 p.m. After supper at the Northern an informal reception would be held. Saturday, the last day, would be occupied by a visit to that famous historical spot, Silver Islet, and at 2.30 p.m. all would be homeward bound, on a C. P. R. train for the east.

The weather, however, during the meeting was so inclement and forbidding that when a canvass of the members was taken on Friday night a very large number were disinclined to undertake the long journey, and indeed only some twelve, of whom the greater number were Canadians, were found willing to go. A meeting of the committee was hastily called together, when it was unanimously decided that it would be manifestly unfair in the circumstances, to put the hospitable people of Port Arthur to so much trouble and expense on behalf of such an insignificant party, and the trip was accordingly reluctantly abandoned. When Mayor Gorham heard of the decision he promptly wired that even if twelve came they would be fittingly received and entertained, but the message came too late, for the Sudbury party had gone west and the remainder were in Montreal. We trust this statement of the facts will eliminate the harsh and unfair judgement of some ignorant persons who have published that the failure of the trip was entirely due to the indifference of the Ottawa Committee.

In view of this unfortunate occurrence—the only hitch we may say in the whole programme of an eminently successful Meeting—the committee will return to the Ontario Government a large portion of their liberal Grant, from which only a *pro rata* rate will be deducted for operating expenses, as well as the cost incurred by the trip to Sudbury. We now hasten to describe the

Excursion to Montreal, the Eastern Townships and Quebec.

(By A. S. Bestus).

The recent visit of the American Institute of Mining Engineers to our city is one which, taken in connection with the several excursions with which it has been associated, should be of the greatest importance not only to the mining industries in our immediate vicinity, but to those of the neighboring Province of Quebec. With the exception of the unfavorable condition of the weather, which, unfortunately, the local committee could not control, it may safely be said that not only the Ottawa meetings, but these several excursions were successful in the highest degree, and it is hoped that our visiting friends and brethren of the profession will carry away with them many pleasant remembrances of their trip which will not speedily be forgotten. The gentlemen who composed that distinguished body represent not only the various mining industries of the country, such as gold, copper, silver, iron, coal, etc., but also number many who are intimately connected with those industries, viz., manufacturers of all kinds of mining plant, such as steam drills, smelting works, and in fact all kinds of engineering machinery, and we trust that during the few days they have spent with us many facts have been presented to their more immediate attention, which, if not entirely unknown to them before, will give them a much broader idea of the extent and value of some of the leading economic minerals of the country, both as to their mode of occurrence, the great value of the mineral wealth of the Dominion, and the great inducements presented at many points for the investment of capital judiciously applied and skillfully administered. While with limited time at their disposal it was of course totally impossible to show them even a small part of our resources in this direction, sufficient has, it is hoped, been done to give them some slight impression of the growing importance of Canada from the miner's standpoint, and the time and money so generously spent by our several governments have, we feel, been well and judiciously expended.

The excursions contemplated during their visit with us were three, viz.: that to Sudbury and Port Arthur, of which, unfortunately, it was found impracticable to carry out a part of the programme; that to the phosphate deposits, in which all participated; and that to the Eastern Townships of Quebec. This last may be said to have been eminently successful, and many points of interest were presented, some of which at least were new to many of the party.

IN MONTREAL.

Leaving Ottawa by the 8 a.m. train on the Canada Atlantic Railway the excursion eastward, which numbered nearly forty persons, including ladies, had a pleasant run to Montreal, a special parlor car being set apart for their accommodation *en route*. Here, though scant notice of their coming had been received, the visitors were kindly received by acting Mayor Perreault, Aldermen Wilson, Dufresne and Rolland, City Surveyor St. George and other prominent citizens, by whom carriages were provided and the entire party driven to the St. Lawrence Hall. On arrival a short address of welcome was tendered the visitors by Mr. Perrault, and replied to by Prof. Eggleston, of New York, and by Mr. B. T. A. Bell, the genial secretary of the general committee at Ottawa, to whose indefatigable exertions much of the success of the excursion must be attributed. A kind invitation was at the same time presented through Prof. Bovey, of McGill University, from Sir Wm. Dawson, to visit the Redpath Museum as well as to a Reception by Sir Wm. and Lady Dawson at their college residence in the evening. Lunch over the party again assembled and were escorted by the Mayor and aldermen, with others, in carriages provided for the occasion, through the principal portion of the city, then to the Redpath Museum, and subsequently along the beautiful mountain drives to the mountain park where a nicely appointed luncheon had been provided by the city fathers for the entertainment of their visiting friends. Though the weather was chilly, the drive, new to many, was thoroughly enjoyable, and the magnificent views that were presented at various points along the drive, and from the foot of the mountain called forth many hearty expressions of admiration on all sides. At the restaurant happy speeches were made by several of the aldermen, and replied to in well chosen words on behalf of the Institute by Mr. J. C. Platt of Waterford, N.Y., and Dr. Ashburner of Pittsburgh, the whole entertainment being a delightful surprise throughout. A point which particularly delighted the visitors was the magnificent fountain in Victoria Square, which played for some time during the drive, and forcibly impressed all who saw it with the immense head of water with which the city is provided in the event of fire, and for the general purposes of the city supply.

In the evening in response to the cordial invitation of Sir William and Lady Dawson, a considerable number attended at their residence, when a very pleasant hour was passed, the party returning to their headquarters highly delighted with the splendid hospitality which had been extended to them during the day and at the very outset of their eastern excursion.

Sunday was a day of rain. In spite of the disagreeable weather most of the visitors attended worship at some of the many churches for which Montreal is famous. In the evening a cordial invitation was extended to the engineers by the Hon. Mr. Mercier to a reception at his own house on St. Denis street, which in spite of the fact that many were tired and had preparations to make for an early start next morning, was responded to by a dozen or more. Among those present to receive them with the Premier were Mr. Robidoux, M.P.P., Mr. James McShane, ex-Minister Public Works for Quebec, and Mr. Wainwright, of the Grand Trunk Railway. A couple of hours were pleasantly spent in discussing the aim and work of the Institute, after which Mr. Wainwright cordially tendered on behalf of the Grand Trunk Railway, a free Pullman service and transportation to Quebec and return, for as many of the members as could accept it, that they might inspect the scene of the late disastrous rock slide and view the other attractions of that historic old city. Mr. Mercier kindly promising them the hospitality of the city during their brief visit. It is needless to say that those of the engineers who attended Hon. Mr. Mercier's Reception on Sunday evening were delighted with the courtesy and hospitality they experienced, and came away with pleasant feelings towards all concerned.

AT CAPELTON COPPER MINES.

Monday morning opened dark and threatening. Jupiter Pluvius was evidently to the front, but in spite of the rain there were no laggards when the time for departure to the train for Sherbrooke was announced. The party during Sunday was augmented by the arrival of several of the members who had gone west to Sudbury from Ottawa on Friday night and returned to take part in the eastern excursion, and nearly fifty persons embarked on the two Pullmans provided for the Townships portion of the programme. The heavy rain in no wise served to damp the happy spirits of any on board, and the best of good fellowship prevailed. All seemed determined that

in spite of adverse circumstances the trip east should be both pleasant and profitable, whatever the weather prophets might say. The 100 miles to Sherbrooke was soon travelled, and on the arrival there the visitors were met by the Sherbrooke committee, headed by Mr. R. N. Hall, M.P., Col. Lucke and others, the warmth of whose welcome speedily put to flight any dullness which the incessant rain might have provoked. Carriages were in waiting, and the whole party were speedily transferred to the Magog House, where a well appointed lunch and the best of good feeling soon made everyone as cheerful as possible. Cwing to difficulty of transport and train service the programme was of necessity changed slightly at this point, and it was decided to visit the copper mines at Capelton in the afternoon of Monday and proceed to Thetford and points of interest on the line of the Quebec Central Railway on Tuesday. An engine was therefore attached to the Special, and the whole party proceeded to the Eustis mines, where the general manager, Mr. John Blue, was on hand to render any assistance in his power, and to furnish any desired information concerning the workings either above or beneath the ground. Cwing to the heavy rain it was impossible for the ladies to visit these interesting works, while the magnificent scenery for which this portion of the township is celebrated, had perforce, also to remain invisible. The gentlemen, however, visited the smelting works which have lately been put in working order, and then arraying themselves in all kinds of motley garments known to mining men, a number explored the deep workings for which this mine is famous, to a depth of nearly 1500 feet, viewing with much interest the immense body of ore which is now being worked so successfully and which is reported to have in places a thickness of from 50 to 60 feet. The greater part of the output is shipped in the raw state to the acid works near New York, but about 1,000 to 1,200 tons per month are smelted on the spot, the sulphur, which represents about 40 per cent of the ore, being burned off and wasted. The ore contains a small amount of silver, from 3 to 4 per cent, which forms an important feature in the value of the output.

The adjacent mines of G. H. Nichols & Co., with which are connected extensive works for the manufacture of sulphuric acid and superphosphate, were not thrown open to the inspection of the engineering party, but as the character of the ore and the conditions of its occurrence are presumably the same at both places, the mines being located on what is regarded as the same vein, the real object of the visit was obtained. The return to Sherbrooke was pleasant in spite of the rain, and after a cheerful supper and an impromptu concert by several members, in the train, which was side-tracked for the night, and which made the evening pass most pleasantly, all turned in for the night, delighted with the first day and with their first acquaintance with the genial people of the Eastern Townships, and more especially with the welcome which had been extended them by the hospitable city of Sherbrooke.

VISIT TO DUDSWELL AND THE ASBESTOS MINES.

Tuesday morning the heavy rain clouds seemed to have nearly exhausted themselves. Fitful gleams of sunlight appeared at intervals and the indications were that a tolerably fair day would be afforded for the trip to the celebrated mines of Thetford and Coleraine and the Dudswell Lime works. The former were of special interest to the members of the Institute from the fact that they are really the only mines of the kind worked to any extent in America. The mineral is not a true asbestos or hornblende, but is a chrysotile or fibrous serpentine, and occurs in veins, which traverse the serpentine in all directions, its mode of occurrence being of particular interest to many of the visitors.

After a comfortable breakfast at the Sherbrooke House, rendered necessary by the length of time which would have been required to feed so large a party in the Pullman buffets, the Sherbrooke excursion committee, consisting of Messrs. R. N. Hall, M. P., Buck, Lucke and Mitchell and others, took charge of the party. A dining car, improvised for the occasion and well stored with a magnificent lunch provided by the local committee and by the managers of the several mining centres was attached to the Pullman train, and at 8.30 the excursion steamed out of the station of the Quebec Central Railway, matters being greatly facilitated by the courtesy of the general manager of that line, Mr. Frank Grundy. The party was here augmented by the presence of a number of Sherbrooke's pleasantest people, both ladies and gentlemen, and by the managers of the several mines at Black Lake and Thetford, including Messrs. King, Sheridan, Murphy and Frechette, who had come down the previous evening in order to become better acquainted with the distinguished visitors and to better extend to them the hospitalities of the mining section. A pleasant ride through the charming scenery of the St. Francis valley brought the excursion to its first stopping place, the Lime Works of the Dudswell Lime and Marble Company, where the four new kilns of the Dominion Lime Co. were inspected with great interest. These kilns, which are four in number, have a daily capacity of 300 barrels each, and are supplied with rock

from a splendid quarry adjoining, the stone being hauled by train to the platform and dumped direct into the kilns. This lime is celebrated for its great purity and is surpassed by that of no other lime works in Canada or the adjoining States, the amount of foreign matter being not more than one per cent. At the Upper Lime Ridge Works, half a mile distant, owned by the same Company, six additional kilns are in operation. The face of the quarry here is about 90 feet in height and close to the kilns. The aggregate daily capacity of these works when all the kilns are in operation is 3,000 barrels, and the owners find it difficult with this immense output to fill all the orders which come in from all parts of Eastern Canada and the adjoining States. Time did not permit us to visit the marble quarry two miles distant, but specimens of the rock were shown and much admired. The train was again soon in motion for the run to Black Lake, and in order to lose no more time a lunch, embracing everything that could be desired was served on the way, the fresh air and exercise, and the universal feeling of good fellowship causing everyone to appreciate the good things provided to the fullest extent. Choice bits of scenery abounded, and the run to Black Lake, which was reached at 1.30, was enjoyable in the extreme. Too much cannot be said of the geniality of the hosts of the day, who were untiring in their efforts to make everything thoroughly pleasant, and it is needless to say, judging from the delighted remarks of the visitors, they succeeded admirably. At Black Lake, the party quickly dispersed under the guidance of Mr. R. T. Hopper, one of the principal mine owners at this point, Mr. Frechette, Dr. Reed and others, and were soon scattered about the several asbestos mines which are in close proximity to the railway. The Anglo-Canadian, Frechette, the Scottish-Canadian, and the most remote, the American, lately started by Mr. E. Wertheim, were all visited, the mode of occurrence of the asbestos was pointed out, and a blast fired by electricity at Mr. Hopper's mine brought down a large amount of serpentine and disclosed some excellent veins of the mineral. The methods of mining, cobbing and grading were explained, and the large veins and fine quality of asbestos which show in the cuttings on the face of the hills at an elevation of over 300 feet above the railway were greatly admired. At the American Company's Mines the party examined with great interest the samples of the manufactured product, made at Frankfurt, Germany, including fire-proof wall papers, gaiters, shoes and head pieces for the protection and use of firemen, and those employed in large blast furnaces. Before leaving, Mr. Klein, the courteous manager, presented the ladies with some of these as mementos of their visit to Black Lake. One hour only could be devoted to the various mines in this locality, but the time was thoroughly occupied, and at 3 p. m. the train steamed into Thetford, the headquarters of the industry. Here the largest mines are situated, embracing those of King Bros., the Bell Co., Irving, Johnson & Co., Ross, Ward & Co., A. H. Murphy, and Lucke & Mitchell. The party were here taken in charge by Mr. Thos. Sheridan, the veteran of the industry, and by Mr. Wm. King, whose large-hearted hospitality is so familiar to all who have had the privilege of visiting this area. These gentlemen, assisted by the other managers, afforded every facility in their power to the visitors for the examination of the several mines, explaining the methods of drilling, hoisting, pumping, cobbing, etc., and everyone was delighted with the treatment they received. It is needless to remark that the visitors pronounced their entertainers "jolly good fellows" all round. The peculiar aspect of the asbestos veins, the presence of granulate dykes, the many indications of slips and faults, in these peculiar serpentine rocks, all presented points of great interest, while more than one of the engineers had their attention directed to the advisability or desirability of inventing some simple process by which the great dumps, which in places, contain a large amount of fibre, can be economically worked by machinery for the crushing and extracting of those veins which, in the present state of the industry are regarded as not warranting the labor necessary for cobbing by hand. It is confidently expected that these important problems will before long be solved and the at present unsightly dumps be made a source of profit.

AT SHERBROOKE.

At 5 o'clock a parting cheer was given to Mr. King and their other hosts and the train started on its home run to Sherbrooke, supper being served *en route*, and at 7 o'clock the city was reached in time to dress for the second part of the day's entertainment, that of the Reception in the Art Gallery by the Mayor and citizens of that charming town.

At 9 o'clock the comfortable rooms of the Art Gallery were well filled. The beautiful little museum in connection with the building was greatly admired, and the members of the Institute, together with many of the leading citizens, were formally presented to His Worship Mayor Bryant, who, with light laughter, did the honors of the occasion gracefully and well. Following the reception was the presentation of an address of welcome

from the city to the members of the Institute, which was accepted and responded to in good style by Mr. Platt, of Waterford, N.Y., on behalf of his colleagues. An excellent speech was also made by Dr. R. W. Ells, in which he ably sketched the remarkable growth and prosperity of the mining interests of that section of the Province, and predicted a great future for them. Music and dancing were in order, with light refreshments well served during the evening, and at the close all expressed themselves freely as having passed a delightful day, the remarks of the visitors clearly showing their appreciation of the unbounded hospitality and courtesy of which they had been the recipients, and their recollections of the friends made in Sherbrooke will assuredly be of the most pleasing kind.

THE RICHMOND SLATE QUARRIES.

Wednesday morning broke fair and sunny, the long season of rain having apparently ended. The Pullmans were attached to the eight o'clock a.m. express to Richmond, and after a pleasant run along the beautiful St. Francis, Richmond was reached at 9 o'clock. Here a special engine was attached and the cars run back to the siding of the new Rockland slate quarry, where they were met by the general manager of the works, Mr. Williams, Mr. T. P. Bacon, Secretary to the Company, and by Mr. Taylor, representing the board of directors. A special vestibule train, constructed for the occasion, had been prepared for the excursion over the company's narrow gauge road to the quarry, about five miles distant, which point was soon reached, the beautiful views along the route eliciting many hearty expressions of delight. Arrived at the quarries, which are extensive and have a depth of 200 feet, the visitors were shown over the works, inspecting the various stages of the manufacture of slate such as planing, sawing, splitting, polishing and cutting, the making of roofing slates and the quarrying of the blocks. The material from the quarry is of excellent quality. The magnificent water power, and the admirable arrangements for its transmission by cables to various points was specially commended, as well as the splendid derrick equipment, the only one of its kind in use in Canada. Many of these improvements are due to the inventive genius of the manager, Mr. Williams, who has placed the works on a most satisfactory working basis, and has won the fullest confidence of the owners and directors by the wisdom of his management. A few of the gentlemen went down into the pit, but the ladies did not venture owing to lack of time. Mrs. Williams played the part of a most genial hostess and at 12.30 the warning whistle notified all present that the luncheon prepared for their guests was awaiting their attention. Adjourning to the school house near by, the room was found to be handsomely decorated with bunting, while three tables, covered with such a supply of good things as to fairly astonish us, were tastefully arranged. Mr. Taylor, as director of the company, presided, and was ably supported by Messrs Bacon and Williams. It is needless to say full justice was done to the magnificent collation provided and when the genial host rose to propose the first toast everyone present was in his happiest mood. Among other toasts, in addition to those of the Queen and the President of the United States, were "The American Institute of Mining Engineers," responded to by Messrs. Platt and Sharples; "The Geological Survey," by Drs. Ells and Bell; "The Ladies," by Mr. Ingall and Mr. Low; "The Manager of the Quarries," "The Secretary of the Ottawa Committee, Mr. B. T. A. Bell, etc." After a couple of hours exceedingly well and pleasantly spent, the Special was resumed and the return trip made to the main line of the Grand Trunk. Here the most of the party visited the neighboring quarry of Mr. Bedard, which is being reopened, and from which a very handsome quality of slate is being taken, although the operations are as yet in their early stages. Thence on to Richmond, where connection was made with the Quebec express for Montreal, where a special car had been provided for the trip to Quebec, through the courtesy of Mr. Wainwright, of the Grand Trunk, and attached to the through train to Levis.

AT QUEBEC.

Thursday morning, on reaching Levis, the brilliant sunshine was gilding the magnificent cliffs of the grand old historic city and giving promise of a glorious day, as if determined that the closing portion of the programme should surpass in enjoyment everything that had gone before. Breakfast was speedily disposed of, and the excursionists quickly ascended the heights and spread themselves along the beautiful terrace, admiring the wonderful scenic panorama spread out at their feet—that view which has been justly styled one of the finest in America. The glorious expanse of the St. Lawrence dotted with shipping, the ranges of the Levis cliffs on the opposite shore, with the handsome city along their crest, and in the distance the charming Island of Orleans, all resplendent in the early morning sun, presented a sight new to most and filled all hearts with a lively sense of its magnificence. The scene of the late terrible disaster was examined, after which the dif-

ferent members scattered through the city, some intent on shopping, others on sightseeing, but all instructed carefully to repair sharp at noon to the Champlain wharf, where the thoughtful kindness of Hon. Mr. Mercier had provided the closing act of the generous round of entertainments and receptions that had greeted the travellers at every point. Punctual to the moment the steamer *Orleans*, which had been chartered for the occasion, was reached and a distinguished gathering of Quebec's most prominent citizens, including many ladies, were ready to extend and to carry out to perfection the regal hospitality for which the old historic city has so long been famous.

After the reception, during which the members of the Institute were presented to the Premier of the Province, and to many of the ladies and gentlemen assisting him, the lines were cast off and the sail around the harbor and up the river commenced. A bright cheery day, gorgeously tinted foliage, magnificent scenery on all sides; the noble St. Lawrence was here seen at her best, and the beauty of the sail to Cape Rouge and return was one of the most enjoyable that can be imagined. A splendid collation prepared in Quebec's best style was served, and everything was harmonious to the highest degree. Returning to the city the trip was continued down river to the Falls of Montmorency, which, owing to the heavy recent rains, presented an unusually magnificent appearance. The return was by way of the St. Joseph dry dock, where opportunity was afforded to inspect this superb work, then across to the celebrated Louise docks, and back to the starting point. The distant Laurentian hills were already covered in places with their mantle of snow, and loomed white in the background, but no breath of wintry air served to chill or mar the flood of genuine good fellowship which reigned on board. The return trip was made doubly pleasant by the drinking of several toasts, among which that of the American Institute of Mining Engineers was conspicuous. A suitable reply to the cordial words of welcome expressed by the Hon. Mr. Mercier was made on behalf of the Institute by Messrs. Platt and Sharples, and the singing of the National Anthem with cheers for the Queen and the President of the United States, closed the proceedings for the day. The excursionists returned to the St. Louis, doubtless weary in body and mind, but so charmed with the warmth and kindness of the entertainment, and of the universal display of good fellowship, that all thoughts of fatigue were for the time, at least, entirely forgotten.

A final dinner at the St. Louis closed the round of Quebec hospitality, and at 8 p.m. the greater portion of the party re-embarked on the night express from Levis to Montreal, at which place the members of the excursion finally disbanded for their respective homeward journeys.

It is presumably not too much to say that of the numerous friendships made during the week of the visit of the American Institute of Mining Engineers many will be hearty and lasting. It is pleasant to know that throughout the entire expedition nothing occurred to mar, in the least, the good feeling and the hearty sense of fellowship that prevailed and was conspicuous on all sides. It is certainly not saying too much if we conclude that the few days spent by our distinguished visitors on the trip through the Eastern Townships of Quebec will be productive of great and lasting benefit to the mining industries of Canada. They are all specialists in their several lines of work. They have seen this section of the country with their business eyes wide open. They are quick to discern a good opening for the placing of capital, not only in mining matters direct but in many other enterprises connected therewith. We can only re-echo the wish already so often expressed, that at some not very distant day a much larger representation of our brethren across the line may invade us, with more time at their disposal, that we may show them other stores of mineral wealth—our silver, our gold, our iron, our antimony, our magnificent quarries of building stone, our coal, both of the east and the west, in fact our mineral wealth as a whole—that they may be able to form some faint idea of the greatness of this fair land, "for it is a fair land." And they can safely rest assured that when they do so visit us again they will find that the hospitality they have so lately experienced is no transient thing designed for the occasion, but one of the great elements of the Canadian nationality of which we are all so justly proud.

A Graceful Acknowledgement.

The Secretary of the Ottawa Committee has received the following letter from Dr. Raymond, under date of 24th inst.:—In accordance with a resolution passed at the Ottawa meeting, it is my pleasant duty to request you to express to Sir John A. Macdonald and to Lady Macdonald the cordial thanks of the Institute for the abundant and graceful courtesy, both official and social, with which they received its visiting members and guests, and in recognition of which you are further requested to present to Sir John A. Macdonald a complete bound set of the seventeen volumes of the Transactions of the Institute.

The Sudbury Mines and Works.

(Read by Dr. E. D. Peters, jr., Sudbury.)

The Sudbury ore deposits possess a peculiar interest for a variety of reasons. In the first place they are deep within the borders of the Huronian rocks, and are consequently amongst the oldest deposits that we know of, unless, indeed, the ores were deposited at a much later period than the country rock. Again, they carry nickel in unusual proportions; and lastly, they are unique in containing a small amount of platinum, although arsenic is not present.

I shall not pretend to go into the geology of this region. The Huronian and Laurentian rocks are familiar to all American geologists, and these present only the usual series of gneiss, graywacke, quartzites, greenstones, clay slates, etc., which are characteristic of this gigantic system of rocks which has excited so much discussion of late years.

As in all parts of Canada where it occurs, I believe, the rocks of this system are tilted to an extraordinary degree, and to such an extent that it may be said that the whole country is standing on edge at an angle of something like 70 degrees to the horizon. The general strike of these rocks is south-west and north-east, and as the orebodies follow the lines of stratification, if it can be called stratification, it follows that the course of the latter is the same as that of the rocks, though local twistings and faults are so frequent that no absolute rule can be laid down as to their direction.

But at least one general feature can be stated as universal, I think, and that is that all the orebodies yet discovered in this region are in close proximity to somewhat extensive dikes, or tilted beds, of diorite. It is usually the case that the ore occurs at the point of contact between diorite and the greywacke, although I think in some cases it is found in the midst of the diorite itself. This diorite is of course a volcanic rock, and is composed properly of quartz, feldspar and a considerable proportion of hornblende, but by the predominance of one or the other of these constituents, and the corresponding diminution of the one or more of the remaining minerals, it forms almost every variety of rock imaginable, and differs so greatly in appearance as to deceive any one who has not had an opportunity to observe its modifications.

This diorite forms the gangue rock of our ore deposits to a great extent, and is a rather favourable constituent than otherwise, as its varied bases and comparatively low per cent. of silica makes it far less refractory in the furnace than the quartzose vein matter that so commonly accompanies copper ores.

The ore itself is a mixture of very pure chalcopryite and of magnetic iron pyrites or pyrrhotite, carrying a considerable amount of nickel, this metal no doubt replacing an equivalent amount of iron.

The mines were worked originally for copper, and it was not till a shipment had been sent to be smelted that it was discovered that they were nickel-bearing to an extent that rendered them far more valuable for that metal than for copper.

As the principal amount of work at Sudbury has been done by the Canadian Copper Co., and as I am naturally most familiar with these mines, I shall describe them more particularly, though I believe in so doing I shall be describing the whole district correctly. I know of no mines there that differ materially from the mines of this company, except that most of the later discovered deposits have shown neither the size or the richness of the earlier discovered ones, a fact that is notorious in the history of almost every mining camp that I am familiar with.

It is very difficult to give any correct statements as to either the size or richness of these beds, as they are so variable in the former particular as to make it impossible to give an average figure, while in the latter, it depends upon the class of deposits to which we are referring, as I will explain later.

In order to give some slight idea as to what these mines amount to, I will divide them roughly into two classes. 1st, those which are composed of extremely massive pyrrhotite and are of enormous extent, so large in fact, that we have as yet obtained no idea of their boundaries; and 2nd, those which are more rocky in their nature and less extended in size, but which are very much richer in both copper and nickel. I do not know but that in justice I ought to make a third class, to which one of our most important mines belongs, which is not only about as extensive as the first class, but nearly as rich in valuable metals as the second series. This is a most unusual and pleasing combination, but is certainly attained by the "Evans" mine, belonging to this company, and quite possibly by one or more of their yet undeveloped deposits.

As I trust that many of my hearers may in a day or two visit Sudbury in person, I will briefly describe the main peculiarities of each of these three classes of mines, illustrating them by the three mines which the Company is now working most extensively for ore, and of which, obviously, each belongs to a different class.

As an example of the first class, I will cite the Stobie mine, situated about 4 miles north of Sudbury on a branch of the C.P.R., built expressly for the use of this mine. Before being opened at all, it simply appeared to be an immense rounded hill of red gossan, presenting about as extensive an outcrop, both as to length and width as I ever saw in my life. As to the length, I will only say that although we have opened it but a few hundred feet longitudinally, yet the outcrop shows it to continue in a more or less unbroken condition for some miles over property belonging to the same company. Upon removing this gossan which consists of a brown iron ore in regular stratified layers, (the product of the decomposition of the pyrrhotite,) we come, within 2 to 6 feet of the surface, upon the unaltered pyrrhotite in an almost absolutely massive condition. At intervals, bands of rock of a very limited extent occur, and occasionally considerable masses of diorite, or of mixed ore and rock. But as a rule the ore is absolutely massive pyrrhotite, with occasional pockets of very pure chalcopryite and not infrequently rounded and even angular occluded masses of diorite, from the size of a chestnut up to immense boulders, weighing many tons.

As you will see at the mine, the position of the ground is favorable for opencast work, and we are at present simply taking the whole hill down as we go, on a level with the valley where we start. We have in some places already cut over 100 feet across the ore, thus proving the width to be very great, and also obtaining a fine face for blasting down the ore in great quantities. Our practice here is to bore a series of holes by air drills 8 to 10 in number, and about 10 feet deep, and as far back from the face of the cliff as we think it is safe to go, and then load the holes heavily with dynamite, and fire the whole series at once by a small dynamo, operated by hand, in the usual way.

In this manner we throw down several hundred tons of ore at a single blast, and for two or three days the men are kept busy in blockholing the large fragments and breaking up and loading the ore, preparatory to a fresh blast. Of course there is nothing original about this practice, but it is rather unusual as applied to nickel ore, and we hope to be able to show you one of these large blasts on your proposed visit to Sudbury.

This ore, although lower in both copper and nickel than the ore from the other two mines that we are working, is yet rich enough in both metals to compare with the best Norwegian or German nickel ores, and is especially valuable to us locally on account of its high percentage in iron, which, after roasting to remove the sulphur with which it is combined, makes a most welcome flux for our richer but more rocky ores from the other mines.

Besides cutting across the vein for a considerable distance, as already mentioned, two tunnels have been continued still further across it for some 60 feet, showing massive ore in their entire extent, as well as in their extreme face. We hope, and intend, to extract a large portion of our winter's supply of ore from these two tunnels, which will enable us to work in comfort when the weather out of doors would be too bad.

You will probably notice that our work at present is not economical, the ore being handled mostly in barrows, and being spalled down to size by hand. This is only a temporary make-shift until a new crusher comes to take the place of an old one that was moved elsewhere, when the ore will be handled directly from the face of the quarry by a derrick operated by steam power and conveyed in cars directly to the breaker, where it will be crushed and screened by machinery and delivered automatically into the small cars, which will run directly over the large railway cars and dump the ore into them very cheaply and conveniently. Within a fortnight this will all be in operation, and the hand work entirely discarded.

The second type of deposit is well illustrated by the Canadian Copper Co's "Copper Cliff" mine. This is situated about four miles west of Sudbury, and some six miles south west of the "Stobie" mine in a B line. The ore here consists of the same pyrrhotite and chalcopryite, but by no means so massive nor in such an enormous deposit. There are many places in the Copper Cliff mine where the ore is as massive as is possible, but in other parts, though rich in the valuable metals, it is much intermixed with diorite.

The ore occurs here in irregular masses of several thousand tons each, situated apparently between two cleavage planes in the country rock, so that we can usually find new ore deposits by drifting in the right direction. Although there are absolutely no stringers of ore or veinlets of quartz to connect these ore bodies, the country rock in their vicinity is usually speckled to a greater or less extent with ore; and this is often the only indication we have of our immediate proximity to a large ore body.

At present the Copper Cliff shaft has reached the 500 foot level, on an incline, and the ore at the greatest depth yet discovered retains its full value in nickel and copper. As the pitch of the shaft is somewhat less than that of the ore, the shaft has long since left the vein, and is now

at some distance above the hanging wall of the latter, so that we have to drift some distance to the rear to strike the proper cleavage plane where we may expect the ore. In the fourth level we have struck a fine deposit of ore, while the fifth level is just fairly started. The third level is our active level at present, though we hope before long to have the fourth and fifth levels in even better shape than the third.

The pure sulphide of nickel, Millerite, is found in many mines which contain no nickel in paying quantities, while in our mines it has only occurred once in the Copper Cliff mine. Then it was in very small quantities, and presented its characteristic appearance of fine wires.

MACHINERY.

The Copper Cliff mine is well equipped with machinery, and has as good a plant as need be desired. It has a double skip-road on an incline way to the bottom of the shaft, the skips dumping automatically at the mouth of the breaker in the top of the rockhouse. Here the ore is sledged to a proper size for the 15x9 Blake breaker, which has a capacity of close on to twenty tons an hour, and passes through a revolving screen, where it is sized into three classes suitable for the succeeding operation of heap-roasting. The coarse size will pass a 4 inch ring, the medium size, or ragging, will about pass a 1½ inch ring, while the fines go through a circular hole of ¾ inch diameter. Each of these sizes falls into a separate bin, under which a car runs on proper T rails. Thus the ore is loaded automatically into cars holding 1½ tons, whence it is transported to the upper story of the ore shed, there falling into a series of bins, from which the ore is loaded by means of inclining steel chutes into the railway cars, and goes direct to the roast-heaps.

Aside from the rock-breaker and its engine, this mine has a fine double cylinder hoisting engine with two drums, and a 7-drill air compressor of the Ingersoll Co's make. We do about all of our drilling with Ingersoll drills, using compressed air, and on the whole find them efficient and tolerably economical.

The further equipment of the mine consists of a machine shop just about completed, and containing a 20 ft. lathe, a good sized planer, as well as a drill press and an Acme bolt cutter, so that we expect soon to do all our machine work at home, thus effecting a large saving. These tools are driven by a 10 inch vertical engine, taking its steam from the main boilers in the compressor building. We further have a couple of home-made hydraulic piston jigs, which we are about to use on some of our fine ore that is too rocky, mostly to demonstrate how well this ore will concentrate, as we have very large reserves of ore that is too rocky for smelting, but that should pay a handsome margin for concentrating.

Our laboratory is also situated here, though it will soon be moved to a much more commodious building at the Smelter, where all our samples will be prepared by machinery, and where our electricity for assaying will be furnished by a small dynamo, thus avoiding the annoyance and uncertainty of batteries for that purpose. I need hardly mention that nearly all our copper assaying is done by electricity, but I think it is more unusual to assay nickel in the same manner, but our chemist, Mr. F. L. Sperry, has succeeded in perfecting a method for so doing, which he will no doubt be pleased to show to any who are interested in this matter.

The third class of deposits is represented by the Evans mine, situated about one mile S.S.W. of the Copper Cliff. This mine contains an immense body of pyrrhotite, which is nearly as massive in places as the lower grade Stobie pyrrhotite, while it runs high in nickel. The copper contents is also very satisfactory in many parts of this deposit, and although it is by no means fairly developed, yet I cannot but regard it as an exceedingly valuable property. The company has valued this mine highly from the commencement, and has thought it worth while to provide it with one of the finest shaft and rock-houses in the country. The ore will be hoisted in cars, on a platform hoist, to the top of this high rockhouse, where it is dumped 12 feet on to the breaker floor, which will hold several hundred tons. The breaker jaws are on a level with the floor, and it is fed with great ease, the ore being automatically sieved, as described at Copper Cliff, and the different sizes falling direct into separate bins, whence it flows direct into the railway cars by merely lowering the respective steel chutes.

At present we hoist with a kibble merely, but even this small affair gives us daily some 50 tons of ore. We have here a three drill compressor, and two good pumps, as I regret to say that both the Canadian Copper and this mine make considerable water.

THE ROASTING PROCESS.

The metallurgical treatment of this ore begins at the roast-yard, where the ore is roasted in heaps to remove the major part of the sulphur and oxidize the iron present as far as practicable.

As I trust you may see in person, this roast-yard has been made at much trouble and expense, owing to the

rough and rocky nature of the ground, and the fact that the only proper site for it was heavily wooded. Two railroad tracks of standard gauge stand in connection with it, one being a high trestle-track which extends longitudinally over the entire roastery, the other being situated 4 feet lower than the roaster-yard and extending parallel with the upper track along one edge of the yard. The upper track is to deliver the raw ore from the mines which, as soon as we can make the necessary arrangements, will be brought in dump cars and dumped on to elevated platforms at the side of the track, whence it will be wheeled on to the heaps which extend in a long row at right angles to the tracks. The roastery is nearly half a mile long and 100 feet wide, so that the length of the piles is limited by the width of the ground, which, after allowing space to get around them, and for drains, is about 80 feet. They are about 40 feet wide, and as the ore is piled about seven feet high on the wood, will hold about 800 tons. They are built in the usual manner, about 30 cords of wood being sufficient to kindle a pile. After the main body of the pile is built up of coarse ore, a layer of ragging or medium ore is put on, six inches to a foot thick, according to the supply on hand, and this is covered in the usual manner with fines. By interposing a layer of rotten wood and chips between the ragging and fines we are enabled to roast both of these smaller sizes more perfectly than is usually done, and in general find the whole heap well enough oxidized to take it direct to the smelter without re-roasting any portion of it, which adds materially to the economy of the operation.

A heap of 800 tons will burn about 60 days, if properly managed. Very great care has to be exercised in this operation, or the combustion will be too rapid, and a great part of the sulphides in the ore will melt down into a solid matter, which is most difficult to break up, and which carries far more sulphur than is permissible. As I have stated many times before when writing upon this subject, almost the entire success of the smelting process depends upon a good roast. If the sulphur is not properly removed a great quantity of low grade matter is formed, into which the iron goes, leaving the silica without sufficient flux, and making the furnace run slowly and badly. While, if it is reduced to the normal amount of seven or eight of sulphur in the roasted ore, a rich matte is formed in comparatively small quantity, thus lessening freight and treatment charges, while the iron that was combined with the sulphur is thoroughly oxidized, and thus in a condition to combine at once with the silica, forming exactly the flux required, and making a rapid, clean and fluid run in the furnace. The importance of this process must be my excuse for devoting so much space, but thousands of dollars are lost every year in metallurgical operations for want of attention to this most difficult and delicate process.

The ore is roasted by contract at a very small figure both for fuel and labor, and by a second contract is dug out of the heaps, which are frequently so fritted together as to require light blasts to loosen it up, and wheeled a few yards to the cars which are standing on the lower-level track already described. Thence it is pushed by the engine up a rather heavy grade on to the track which runs over the bins back of the Smelter, which are calculated to hold nearly a week's supply. At this point, we begin the description of

THE SMELTING OPERATION PROPER.

I think the first thing that will strike most furnacemen on seeing the Canadian Copper Co.'s furnaces is the small size of the building covering them. There are 2 smelting furnaces and 2 buildings, but as they are practically duplicates of each other, it will suffice to describe one. The entire building is 40x65 feet, of which 40x35 is on a lower level, and contains the furnace, while the rest of the floor is 8½ feet higher, and is devoted to the ore and fuel bins. When you consider that the furnace averages 125 tons per 24 hours on favorable ores, I think that the space it takes up is unusually small, though amply large for all requirements. The furnace itself is a steel water-jacket of the Herreshoff patent made by the Jenckes Manufacturing Co. of Sherbrooke, P.Q. It is rectangular with rounded corners, and a slight convexity all round, so that it really approaches an oval. Its section at the tuyeres is 3 feet 3x6 feet 6, and it has 11 2½ inch tuyeres, there being 5 on each side, and 1 at one end, the discharge opening being at the other end. It is 6 feet high from tuyeres to charge-door, and is an unbroken water-jacket, the entire distance from the cast bottom-plate to the charging-door. Above the threshold of this opening, is a housing of boiler iron, lined with fire-brick, which lasts as long as the furnace does. The charge-door is situated at one long side of the furnace, while the flue opening is opposite to it, the entire flue as well as the iron charging platform resting on a series of girders and 1 beam, which are supported by the stone walls of the building and by 3 iron columns which are located so close against the furnace as to be entirely out of the way. The red brick flue enters into a series of zigzag dust chambers outside of the building which are connected with a stack of the same material, 60 feet

high, and 5 feet square inside from bottom to top, its diminution in size, due to the taper of its walls, being fully compensated by the increasing thinness of its walls in height, they being only 8 inches thick for the top 20 feet. All the brick work is securely ironed, so thoroughly that though in operation for nearly 9 months, no crack of any moment has shown itself, and it promises to last indefinitely. This is due to extreme care in preparing the foundations in this frosty climate, and to proper ironing.

The water space in this furnace is only 2 inches wide instead of 6 or 8 as is often the case, and we experience no trouble in consequence. The chief peculiar feature of this furnace is its front connecting reservoirs, or "well," as we term it. It is a circular, cast-iron, water-jacketed vessel, mounted on 4 stout wheels, and so designed that its hole in one side connects directly with the outlet hole of the furnace. This forms a connecting channel a few inches in length thoroughly protected by water-cooling, through which the molten slag and matte flow out of the furnace as rapidly as they are formed. They thus escape the influence of the blast, and any possibility of the great bugbear of copper-smelters, the formation of great masses of cast-iron, metallic iron, called "sows" or "salamanders," is completely avoided, thus robbing smelting of half its terrors. Many of the new varieties of furnaces have some similar provision, but none so convenient and perfect as this, I think.

The slag and metal separate very perfectly in this quiet, spacious reservoir, and the slag flows in a continuous stream over the jacketed lip of the same at a height of some ten inches above the outlet hole of the furnace. This ingenious arrangement completely traps the blast, and owing to it, we never have any foul slag to re-smelt from one week's end to the other. The matte is tapped at intervals of 10 to 20 minutes through a separate bronze, water-cooled taphole-casting, which is bolted to one side of the well, and which is plugged with clay in the usual manner. Owing to its proximity to the hot stream of molten matter from the furnace, the taphole never chills, and instead of the ordinary sledging and labor every time the operation of tapping takes place, with us the furnace-man uses simply a half inch steel bar, which he drives through the clay plug with a few light taps of a carpenter's hammer, the matte flows quietly into a slag pot placed for the purpose, and the small taphole in the casting is closed without any chance of failure by a clay plug, as usual. There is no interruption of the blast, and none of the ordinary excitement and confusion so generally attendant on the operation of tapping. A slight matter, but one worth mentioning, is an arrangement that we have for the better preservation of the cast-iron plates that form the floor of the building around the furnace, and which it is particularly essential to have very smooth and solid, so as to easily draw heavy pots of molten material over them without spilling it. Usually whenever a potful of slag is drawn away from the furnace, and before a new pot can be run in in place of the old one, a considerable amount of slag drops upon the iron plates, which in spite of more or less protection from sand, soon become so warped and out of shape, that within three or four weeks they are totally destroyed, and have to be replaced by new ones, at a considerable expense of time and money. To obviate this universal difficulty, we have cut a circle in the plate just where the stream of slag naturally falls, and have introduced into this a shallow cast-iron basin. The slag drips into this without injuring the plates, and is taken out from time to time by the fork and thrown into the slag pot. The basin stands two months or more before it is destroyed, and is replaced at a cost of 75 cents, and without a moment's loss of time to the furnace.

There is nothing particularly worthy of notice about the charging-floor, except what I have already described. Every pound of ore and fuel is accurately weighed on a 5-beam charging-scale, and is also sampled. In the same way, the matte produced is daily sampled, as well as accurately weighed, before it is dumped from the pot, and the slag is sampled from every potful and assayed once every 24 hours. From these data, we are able to prepare an accurate daily history of the furnace work in each furnace for the benefit of the Directors at home, to whom it is sent in a weekly sheet.

By properly mixing our three different ores, we are enabled to get along without ever using a pound of flux, which is a very fortunate circumstance, as I know of neither limestone or iron ore in the vicinity, that would be suitable for this purpose.

For fuel, we use Penn coke of the best quality, which is brought here via the Great Lakes and the Algoma branch of the C.P.R. at a less cost than might be imagined. We smelt seven to eight tons of ore to one ton of coke, as proved by having our coke overrun when we clean up and estimate our large shipments of some thousands of tons, for there is very apt to be a heavy deficit in coke.

Our furnaces are supplied by wind with two separate No. 6 Baker blowers, one to each furnace. The blower to our No. 2 furnace is provided with a vertical engine which forms a part of the blower itself, while our No. 1 furnace is run by a large Brown automatic engine which

has ample power for other additional work. Our water is pumped from a neighboring stream where we have built a dam and formed a small lake by two duplex Worthington pumps, either of which has ample capacity to supply both furnaces. Two steel tubular boilers, set in one battery, supply steam for the entire plant.

NOTABLE FEATURES OF THE WORKS.

If I were asked to point out the most notable features of these works, apart from the mines, I should mention first the very large capacity of the furnaces, nearly or quite 125 tons per 24 hours for each on fair ores; also the entire absence of flux, owing to a more or less basic gangue rock, and some very massive pyrrhotite from one of our mines, the Stobie; also the very favorable ratio of ore to coke, 6 or 8 to 1, not as the result of an especial trial under favorable circumstances, but from months of average work. The same may be said of the capacity of the furnaces, which is greater than any that I know of running on pyritic ores.

Of course, the chief peculiarity of our product is the large percentage of nickel which our matte contains in addition to its copper contents. Our average matte will be about 27 per cent. copper and 15 per cent. nickel, and both of these metals are of such a purity that when separated they are fitted for the most delicate work, and will stand any tests that any similar metals stand. As every copper smelter knows, we can determine the percentage of copper matte by eye with such exactness that from any percentage between 25 and 80 I have never cared for an assay of it for my own benefit, as my eye will always tell me its copper contents near enough for metallurgical or chemical purposes. But even a very slight admixture of nickel completely masks the color and texture produced by varying percentages of copper, and in our matte I do not think that any one could distinguish between a matte carrying 15 and one carrying 40 per cent of copper, providing that nickel were also present in our usual proportions.

At present we break our matte into large pieces, which we pack into old oil barrels, chinking up the interstices with the smaller fragments. These are shipped to Swansea, or to various German works, according to the bids of the foreign refiners for our product.

It may perhaps be news to some of my hearers to learn that the entire world's production of nickel annually is less than 1,000 tons, the bulk of this being produced by the New Caledonian nickel mines, which are oxide deposits situated in a serpentine dyke. While I am not at liberty to give figures of our production, it will still be very evident to any observer that the world's production of this year will be a good deal larger than that of 1888, and as we are told that New Caledonia is losing money at the present low price of the metal, it is evident that we need not look far for the world's supply. The Gap mine, owned by Mr. Wharton, of Philadelphia, has been for many years the one nickel producing locality of the United States, but is practically out of the running at present prices. Therefore the United States, by its present heavy duty on nickel, is taxing its entire population without its being of the slightest benefit to anyone except a few foreign producers, while it drives away everyone who may desire to establish works for the refining of this metal within its borders, and thus loses a most remunerative industry that would employ great numbers of men and great quantities of material, without obtaining the slightest benefit in return.

DISCUSSION.

THE CHAIRMAN (Prof. Eglestone)—You need have no trouble about your nickel, because just as soon as you make it cheap enough it will be used in every kitchen in the world.

MR. THOS. MACFARLANE—I have no remarks to make by way of criticising this paper, but I do not think we should allow the opportunity to pass without congratulating Dr. Peters on having presented a paper so full of information on the subject of the description of the improvements made in the metallurgy of nickel in a comparatively short period. As he was reading his paper I compared his various improvements and method of treating the ore with what I saw in operation something like thirty years ago at the Reminger nickel works in Norway. I think Dr. Peters will know the locality I refer to.

DR. PETERS—Yes.

MR. MACFARLANE—The improvement in the treatment of the ore is simply enormous compared with the old method of working. I do not see any difficulty at all in this whole matter except disposing of the nickel; but I suppose that will have to take care of itself. I simply rise to express my extreme gratification at having listened to such an interesting paper.

DR. ASHBURNER—I have nothing to say with regard to the metallurgical or geological features of Dr.

Peters' paper, but I have had occasion during the past years to look into some matters in which I think my friend Dr. Peters could help me out. Some three months ago I had the pleasure of visiting Sudbury and of being his guest for several days, and examined with a great deal of interest and instruction the works under his charge. Having received a telegraphic call I regret that I shall not be able to visit Sudbury again with the members of the Institute, as the trip will be of the greatest interest to every one. The geological association of the ores is not only interesting, but the ores themselves are unique. To mineralogists it is of consummate interest, and for geologists the way it occurs in the Huronian rocks is of great interest. As far as the arrangement of Dr. Peters' plant is concerned, I regret that Dr. Peters has not had such a plant erected on the other side of the border, because it is so complete and unique in its way that it seems almost a misfortune that American engineers should have to come to Canada to see something which they cannot see on their own side of the line. The furnaces themselves are particularly interesting in the handling of the sulphide ores which Dr. Peters has been handling there, and remarkable in the quantity of ores which they reduced. We all know the remarkable experience which our recently elected member, James Douglas, although an old friend of many of us, has had in the Copper Queen mine in Arizona, where he has reduced 150 tons of ore in one day in a furnace very much the same size as the largest furnace of Dr. Peters; but the ores are quite different, being largely oxide and carbonate ores and having less than five per cent. in bulk of sulphides; so that while we have been regarding the practice which Jas. Douglas has accomplished in handling the Copper Queen ores, it is really something phenomenal to think of the sulphide ores which Dr. Peters has handled in the furnace at Sudbury. Everyone here who is interested in the matter, either as geologist, mineralogist, mining engineer, or metallurgist, will be amply repaid by a trip to Dr. Peters' works.

DR. PETERS—I forgot to mention Dr. Bell's kind offer to exhibit for the benefit of the Institute some of the Sudbury ores which he has here. One thing I might state which might be useful metallurgically. I have not mentioned the reason why we obtained such a large result from such a comparatively small furnace. I am making some tests now with steel plates which, if they are successful, will enable me to put up a 200 ton furnace to work somewhat cheaper than our present furnace. I know no reason why we cannot smelt 500 tons a day just as well as the amount we now handle. It is all a question of handling. They have conquered all these things in your furnaces, and we feel sure we will have a 500 ton furnace in operation if the steel plates will stand it. The secret of our rapid smelting is not that there is anything remarkable in our ores. It is that we use a very powerful blast, and more than anything that our different ores are most carefully mixed together before they are smelted. Of course we pay great attention to the analysis—to weighing out the exact amounts of ore—to feeding the furnace and other minutiae, but in addition to that, I spoke of two things of importance. One is the blast and the other is the percentage in the heaps. It makes all the difference in the world how the materials are to form that percentage. We find the greatest benefits result from mixing ores of three kinds and roasting them in heaps together. In that way they get so well mixed that every atom of silica has its necessary atoms of lime and iron united with it, and it does not have to run all over the furnace to get its atoms. That is not the scientific way, but it is better that way than if we mixed these ores with a shovel. It has been observed that it makes the ores flux better to mix them—to the extent of ten per cent, if not more.

DR. BELL—As I have been engaged by the Geological Survey of Canada in and around Sudbury for the past two years, and had passed through the district many years before the discovery of copper, I may say that I have listened with a very great deal of pleasure to Dr. Peters' paper. I can bear testimony to the very excellent work he is doing—the perfect working of the furnace and everything in connection with the copper company's mines there. We Canadians may well congratulate ourselves upon the good work Dr. Peters is doing there. I know he has encountered no ordinary difficulties—difficulties which might have been obviated had the authorities co-operated with him and encouraged this industry as they might have done. Dr. Peters has been subjected to criticism by persons who knew not of what they were speaking, but he has gone on and achieved a success which is unexampled in the history of metallurgy and mining in this country. I have no doubt that the company will go on and readily find a market for all the nickel they produce. One reason why it is not more largely used now is on account of the high price. The geological relations of these deposits has been one of my studies, but there is a puzzling question which I had hoped Dr. Peters would have answered, viz., "How came the copper there?" If he had explained to us the

history of the formation of these deposits I should have been very glad.

DR. PETERS—It is your province to say that.

D. RAYMOND—Dr. Peters' business is to get at it. Who put it in as another question.

DR. BELL—It is a puzzling question, and one which geologists, mineralogists and chemists cannot even answer. Dr. Peters is an experienced man, and possibly he might tell us something of the behavior of copper under high temperatures. If he has any theories I should like to hear them.

DR. PETERS—I have none.

DR. RAYMOND—I only desire to add a word or two to what has been said to express my adhesion to the praises of our friend's work. It is a good many years now—more than twenty years—since I first met Dr. Peters, struggling with greater difficulties than seems to be his perennial lot to-day, in South Park, Colorado. We lost sight of him for a while, but he has now, as the practical manager of these works at Sudbury, and as the author of our best book on the metallurgy of copper planted himself so prominently in our profession that we hope he will never get out of it. With regard to this matter I had made a note to express my own desire that if Dr. Peters had—well you know what in Dickens' novel, "Great Expectations," what Gargery says to Pip, "Wasn't there a dog Pip? Not a small dog? Nor a pup?"

Now if Dr. Peters had only a small hypothesis, or a "pup" that would become a hypothesis, that would throw any light on this paragenesis of sulphide copper ore or other minerals which surround it, we should be glad to know of it. Dr. Bell and I had a talk at the Geological Museum this morning on this subject in the presence of specimens from the old Acton mine. Allusion has been made to the presence of organic matter, indicated sometimes by bituminous rocks and sometimes by fossils, and I suppose in the gangue of reduced ores, in which class I might include native ores of sulphides. Native ores might have been reduced from oxides, and sulphides from sulphates. In the days when I was lecturing, as a desperate resort I have been accustomed to say when inquisitive students would attempt to corner me with importunate questions, that where we could find traces of bitumen we had reason to assume the presence of organic matter, and fossils the same, but where we did not find any we could assume that they had not been there. In that way I got out of it. I can say honestly, since we have grown up and have no class present I do not mind confessing it, I cannot say that I am altogether satisfied with my theory on that point. I think the whole subject of the diffusion of sulphides in places where the reducing agent is not present or indicated is not easily to be conceived—is one that is a mystery in the good old fashioned sense of a mystery. That is a thing not yet found out. When it is found out it may be simple enough. It is not necessary that the clue should be everywhere present. When we find clear proof of such a genesis we shall be able to infer it and apply it to some other place. In the Jersey iron mines the distribution of our ores is pretty much in the same position and shape of those at Sudbury—that is in chutes or pods, sometimes in echelons, as they seem to be enclosed in siliceous crystalline schists, and clad as if they had been at first set up with these crystals around them. In the mines which I am managing at present for Cooper, Hewitt & Co., we have not a single case where any fault can be traced. The recrystallization of the rock had obliterated all traces of the "fault" anywhere from ten to thirty feet, and as it did not bring in another kind of rock we passed from one to the other, and not being close observers we got from gneiss to gneiss and did not realize that we had passed any "fault" at all, but finding ourselves out of the deposit we cross-cut in the direction as indicated and found another. If we had only a single case of copper ores in such condition as the Sudbury mines present, or the old Acton mines present, I think we might, in default of a better explanation, hold up our heads with courage to the young aspirant and fire off an explanation. But when these sulphides are deposited in now bituminous, now fossiliferous limestone, as in the copper of the Ducktown range, associated as they are say with pyrrhotite and also a small percentage of nickel, we have got an adequate explanation of their genesis. I want to ask whether Dr. Peters attaches any significance to the presence of nickel universally, although in small proportion, in all that pyrrhotite group of mines extending from Litchfield, Conn., way down the Alleghanies to Ducktown—the whole range—limonite at the top, then concentrated copper ores lodged down to the water line. The persistence of the line makes it a geological horizon; but so far as I know no special light has been thrown on the genesis of it. I would also like to ask another question and that is whether anything particular has been done in the

relation of alloys of phosphorus and nickel in developing metals of extraordinary strength and elasticity. Dr. Peters' paper gives us an idea of the process that has been going on during the past ten years in all American metallurgy, and has placed it at the head of the metallurgy of the world to-day. It is the process of sweeping away a thousand details and cobwebs which we supposed up to a few years ago to constitute the science of metallurgy. Distinctions and infinite comparisons beyond compare. But what could we do? In iron? We put wrought iron hoops around our furnace—got a good strong engine and blew. We have forgotten now how we crushed the ore, and a great many things we supposed to be symptoms. We are all now valetudinarians. We simply watch our furnaces and the symptoms take care of themselves. Ten years ago, I stood up at a meeting of the Institute and told those assembled that I had had more experience and knew more about taking care of a blast furnace in difficulty than in taking care of one which was running well. We went through indescribable troubles and difficulties and agonies with our Durham blast furnace. She was built for 400 tons a week, and we struggled along and were proud of an average of 250. We ran down to 50 tons, and to nothing sometimes, and we scaffolded and performed surgery upon her, and all the forms of injection, the blowpipe, dynamite and everything that anybody could do, and we had all the trouble there was to be had. Now, last week we were making 850 tons out of that furnace with very close to a ton of fuel to a ton of iron. For a long period our record of fuel had been surpassed by our neighbors, the Glenoid people, but our record has not been surpassed of late. I say that not on my own authority, but on that of Sir Lowthian Bell, when our figures for a long time had been submitted to him. As soon as we got into that way of blowing very hard and working fast, keeping her feet warm and her head cool, all the internal dissensions disappeared. A great many things that used to trouble us to death if we were working along in the old fashioned way have disappeared. Main strength has been the secret of success in modern blast furnaces. We borrowed from our friends of the lead smelting industry the water jacket hearth. We are practically blowing with a certain sort of superstition in the encouragement of fire brick manufacture, for we still put fire brick there, but we have a water cooled hearth, and good hooping that holds every thing in. Our furnaces stand 15, 16 and 20 lbs. to the inch and we make things melt. What else can they do? (Laughter). With regard to the boon in water jacket furnaces, which our brethren in the lead industry have bestowed on us, we have returned it by the example of Mr. Herreshoff. He has come to use main strength as Dr. Peters has. What he has come to do in copper was done in the metallurgy of lead when they took hold of that business and restored to life the old idea of beginning to make large furnaces and smelting large amounts of ore. In the early days when there were some thirty furnaces running, we would get up in the morning and count how many were bugged up that day. When the salamander was acting it was sending off an awful lot of fumes, and by the volume of these fumes which were staining the sky we could see how many were shut down. It was a regular thing to have a salamander every eight days. They would hitch oxen to the old salamander and drag it out, until I have seen half acres covered with them, then I have known the managers to dig under them and bury them, and in days to come geologists may dig there and find curious nodules. (Laughter). There will be wrought iron found in curious deposits. In the metallurgy of the future we are going to apply energy, and we are going to get more energy by the combustion of fuel, in transmission by electric conductors, and in all ways to overcome difficulty by force. We are going to stop fooling with nature and just charge, attack, and she will give up. (Hear, hear). Put on the force and she will give up. One word further. Dr. Peters has revealed accidentally what is the secret of metallurgy and what will prevent our friends the chemists from having the control. Mr. Macfarlane looks glum; but the chemists are not going to be left out. That is the study of the slag as the true guide for the metallurgist. It doesn't lie. That is the study of the slag and increased facilities for its analysis. By practice and skill we shall be able to train our foremen to recognize the physical signs of the slag. I remember some years ago Mr. Macfarlane suggested a rapid method of determining the density. It is not always necessary to do that. There is a science not written in books, and not known to many outside of the locality where it was born; but in every place every metallurgical director who is worthy of his place and rises to the full capacity of his skill, will train himself and his foreman to read the melted surface of the slag. (Hear, hear). He will know what it is when he looks at it. Then there will be the necessity for the chemist to verify this rapid observation. I think it is being based on copper by the book of Dr. Peters. (Applause). I am proud to think that other books such as those by Mr. Staderfeldt took rise in papers read before this Institute, while many other works springing out of our

transactions are enriching the technical literature of the world, giving us a little to life and earning for us the gratitude of mankind.

DR. PETERS—I dislike to take up your time, but it would be discourteous not to reply to a few of the questions which Dr. Raymond has asked me. I am however, overwhelmed with the praise of my professional brothers. I came here ashamed of my paper because I know it is not a good one. I sat down to the typewriter and did not have an opportunity to read it over afterwards. The reason for this is because I have so much work to do, and under the circumstances I must thank you for the indulgence you have given me. In regard to this conundrum as to whether I attach any significance to the occurrence of nickel in pyrrhotite in this long range running north and south, I do not. There is a little bed in the Ely mine, but whether I have found all the pyrrhotites to have copper, I say no, I have not. I have been aware of the fact that there have been such breaks. There are such breaks in the Ely mine, where there is hardly a trace of copper, and in others where there were cobalt and platinum.

PROF. EGLESTON—You have not spoken of Sperrilite?

DR. PETERS—The platinum in our mines does not occur in the form of Sperrilite. It is Arsenite. I do not know of any other pyrrhotites containing one and a half per cent of nickel except those of Mr. Horton.

PROF. EGLESTON—It is three-quarters of one per cent.

DR. PETERS—I put it at a half per cent.

DR. ASHBURNER—The ores of the Pennsylvania mines certainly run less than one per cent.

MR. MACFARLANE—I think the Cap mines have had one and a half per cent. of nickel.

DR. PETERS—I speak of the Cap mine by itself. I can speak, however, of what no one seems to have noticed, I refer to this extraordinary fact that pyrrhotite occurs in one place and pyrite in another without any apparent reason. If that fact were answered it would give us the methods of deposition.

MR. MACFARLANE—Pyrite frequently contains cobalt.

DR. PETERS—Yes; but pyrrhotite does not.
(To be Continued.)

British Columbia's Coal Fields.

"The Comox and Nanaimo coal fields are the most important in the province, and the latter is that from which almost all the coal so far raised has been obtained. The cretaceous rocks constituting these coal fields border the southwestern side of the Strait of Georgia, forming a belt of comparatively low rolling or hilly country between the mountainous region of the interior of Vancouver Island and the coast. The quality of the Comox coals is equal, if not somewhat superior, to that of those of Nanaimo. They contain but a small percentage of water and the ash is also very low. Several of them yield strong cokes. The area of the Nanaimo coal field is estimated at about 200 square miles. There are at least two distinct seams of workable thickness in this area, but in consequence

of folds and faults it is not easy to fix the equivalency of beds in its various parts. Three collieries are at present in operation here, the Nanaimo, Wellington and East Wellington. The works of the two first named are on a very extensive scale, embracing numerous shafts and inclines, provided with good machinery, railways and wharves. In the Vancouver Colliery the principal workings are upon a seam which averages from 6 to 10 feet in thickness. A second seam, overlaying the last and separated from it by 140 feet of sandstone, is 7 feet thick. The seam worked in the Wellington Colliery averages about 9 feet in thickness, and yields a rather dry steam coal which does not afford a strong coke. The coal from the Vancouver Colliery, on the contrary, gives a good coke and produces a large quantity of illuminating gas."

In 1850 a chalk cliff about 200 feet high, near Seaford, on the coast of Sussex, was thrown down by the explosion of 24,000 pounds of powder, and 292,000 tons of rock were dislodged.

At Holyhead, in 1850, a hard quartzose schist cliff was thrown down by 12,000 pounds of gunpowder. About 40,000 tons of rock were dislodged, which was used for the harbor works at that point. In January, 1867, another blast was fired at the same place, in which 16,000 pounds of powder dislodged 120,000 tons of rock.

Leases for Mines of Gold, Silver, Coal, Iron, Copper, Lead, Tin

— AND —

PRECIOUS STONES.

Titles given direct from the Crown, Royalties & Rentals moderate

GOLD AND SILVER.

Under the provisions of chap. 7, Revised Statutes, of Mines and Minerals Licenses are issued for prospecting Gold and Silver for a term of six months, which can be extended by renewal for another six months. Mines of Gold and Silver are laid off in areas of 150 by 250 feet, any number of which up to one hundred can be included in one License, provided that the length of the block does not exceed twice its width. Up to five areas the cost is 50 cents per area, for every area in addition 25 cents. Cost of renewal one half the original fees. Leases of any number of areas are granted for a term of 21 years. These leases are forfeitable if not worked, but advantage can be taken of a recent Act by which on payment of 50 cents annually for each area contained in the lease it becomes non-forfeitable if the labor be not performed.

Licenses are issued to owners of quartz crushing mills who are required to pay Royalty on all the Gold they extract at the rate of two per cent. on smelted Gold valued at \$19.00 an ounce, and in smelted Gold valued at \$18.00 an ounce.

Applications for Licenses or Leases are receivable at the office of the Commissioner of Public Works and Mines each week day from 10 a.m. to 4 p.m., except Saturday, when the hours are from 10 to 1. Licenses are issued in the order of application according to priority. If a person discovers Gold in any part of the Province he may stake out the boundaries of the area he desires to obtain, and this gives him one week and twenty-four hours for every 15 miles from Halifax in which to make application at the Department for his ground.

MINES OTHER THAN GOLD AND SILVER.

Licenses to search for twelve months are issued, at a cost of twenty dollars, for Minerals other than Gold and Silver, out of which one square mile can be selected for mining under lease. These leases are for four renewable terms of twenty years each. The cost for the first year is fifty dollars, and an annual rental of thirty dollars secures each lease from liability to forfeiture for non-working.

All rentals are refunded if afterwards the areas are worked and pay royalties. All titles, transfers, etc., of minerals are registered by the Mines Department free of charge, and provision is made for lessees and licensees whereby they can acquire promptly either by arrangement with the owner or by arbitration all land required for their mining works.

The Government as a security for the payment of royalties makes the royalties a first lien on the plant and fixtures of the mine.

The unusually generous conditions under which the Government of Nova Scotia grants its minerals have introduced many outside capitalists who have always stated that the Mining Laws of the Province were the best they had had experience of.

The royalties on the remaining minerals are :—Copper, four cents on every unit ; Lead, two cents upon every unit ; Iron, five cents on every ton ; Tin and Precious Stones, five per cent. ; Coal, 7½ cents on every ton sold.

The Gold district of the Province extends along its entire Atlantic coast and varies in width from 10 to 40 miles, and embraces an area of over three thousand miles, and is traversed by good roads and accessible at all points by water. Coal is known in the counties of Cumberland, Colchester, Pictou and Antigonish, and at numerous points in the island of Cape Breton. The ores of Iron, Copper, etc., are met at numerous points, and are being rapidly secured by miners and investors.

Copies of the Mining Law and any information can be had on application to

THE HON. C. E. CHURCH,

Commissioner Public Works and Mines,

HALIFAX,

NOVA SCOTIA.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantity

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

WM. H. DICKSON,
160 Waller St., Ottawa.

SHIPMAN ENGINES, ACME MODEL. COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

January, 1889.

NOTICE

Is hereby given that all communications in respect to matters affecting the Department of Indian Affairs should be addressed to the Honorable E. Dewdney as Superintendent General of Indian Affairs, and not as Minister of the Interior, or to the undersigned. All Officers of the Department should address their official letters to the undersigned.

L. VANKOUGHNET,
Deputy Superintendent-General
of Indian Affairs.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

**ONTARIO
Mining Regulations.**

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with an application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

A. S. HARDY,

Commissioner,
Department of Crown Lands, Toronto.

	THIS SPACE	
	OPEN FOR CONTRACT.	

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Hot Water Heating Apparatus, Prescott, Ont., will be received until Wednesday, 18th December next, for the construction of a Hot Water Heating Apparatus at the Prescott, Ont., Post Office, and Custom House Buildings.

Plans and specifications can be seen and form of tender and all necessary information obtained at this Department and at the Clerk of Works Office, Prescott, Ont., after Wednesday, 4th December next.

Persons tendering are notified that tenders will not be considered unless made on the printed form supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By Order,
 A. GOBEIL,
 Secretary.

FIRE FELT

is a new Non-Conducting material, made into sections to fit any size of pipe, and into rolls and sheets for large surfaces. It is a flexible felt-like fabric, made of pure Asbestos. It has been demonstrated by the U. S. Navy and others to be superior to hair felt as a non-conductor, and is indestructible by heat. Covering your Steam or Hot Air Pipes will save from 10 to 40 per cent. in fuel and give dry steam at long distances.

SOLE MANUFACTURERS

The Chalmers-Spence Co.,

Largest Consumers of Asbestos in the World.

419 to 425 E. Eighth Street, NEW YORK.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter with original bores of 3 and 3½ inches, bushings to be used for intermediate sizes; larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.
22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to **THE DODGE WOOD SPLIT PULLEY CO., TORONTO.**

THE DOMINION SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

Some of Our Leading Customers:

The J. A. Converse Mfg. Co. (A. W. Morris & Bro.), Montreal; The Canada Sugar Refining Co., Montreal; The Pillow and Hersey Mfg. Co., Montreal; The Berthier Beet Root Sugar Co., Berthier, Que.; The Imperial Insurance Co., Montreal; The Massey Manufacturing Co., Toronto; The Acadia Coal Co. SHIPMAN ENGINES, ACME MODEL.

COAL OIL FOR FUEL.

To parties requiring a safe, reliable, durable and economical Steam Launch, from 20x4 to 35x7 with ample power to give satisfactory speed can supply the best on the market and at prices which will defy competition for a like quality of goods. We have a full staff of competent boat and engine builders and guarantee every article to be strictly first class. Hundreds of our engines from 1 to 12 h. p. Marine or Stationary have been in use for years and are acknowledged superior to all others. No smoke, dirt or sparks, no manual or mechanical labor necessary. You have the privacy of your launch for your family. As the water and oil supply is automatic very little attention is required. But a few minutes is necessary to get up 100 lbs. of steam; when you return to the boat house by turning a hand wheel all fire is extinguished. Orders for coming season should be placed at once, as the demand is much in excess of previous years. Write for 1889 circulars giving prices, testimonials, etc. No attention paid to postal cards.

Geological Survey of Nova Scotia.

It is rumored that the authorities of the Geological Survey will issue the geological map of Nova Scotia upon the reduced scale of four miles to the inch. It is difficult to see the object of the Survey in thus reducing the scale, for the field work and original plotting have been done upon a scale of one mile to the inch, and the proposed change means a great deal of labor for the draughtsmen of the department, and a consequent delay in the issuing of the map. Moreover the map of Cape Breton made by Mr. Hugh Fletcher, and already published is on the scale of one mile to the inch, and is as beautiful and admirable a piece of work as one could desire, and has done a great deal to keep up and sustain the reputation of the Survey. To publish the map of the rest of Nova Scotia upon a reduced scale would be a great mistake in our judgment, and would mar the beauty and utility of the work already published.

The utility of a geological survey depends largely upon its ability to help the instruction of the people in the application of science to the enlargement of their practical knowledge, and consequent increase of their material and national prosperity. Not a small part of the development of the natural resources of our neighbors across the line, particularly of the Eastern States, has come from the various State Geological Surveys which have been going on more or less for the past fifty years.

Nova Scotia has been, and is to-day, whatever the future may bring forth, the foremost province of the Dominion in the matter of mineral development, and no parsimonious spirit should actuate the Government in carrying forward upon the same liberal scale the work of the local staff of the Geological Survey. To stultify or embarrass in great measure the admirable work which has already been done and is doing by such a reduction as we have indicated would be a piece of penny wisdom and pound folly.

The Future of Phosphate.

In the inaugural address of the President of the Ottawa Literary and Scientific Society on the 14th instant, Mr. H. B. Small, whilst treating of development and progress alluded to the exhaustion of the soil by repeated cropping without restoring artificially the mineral waste annually taken out in grain. He quoted from a statement made by Mr. Gordon Brown in 1869 that the shipments of grain in that year from the port of Montreal contained 2,340 tons

of phosphoric acid, and that to have restored that to the surface of country represented in the shipments 5,850 tons of apatite would have been required. On this point Mr. Small said: "This again leads to development; our new phosphate industry, the product of which is not yet used at home, is in constantly increasing demand abroad, and when its necessity becomes apparent here, such a development will take place around the scene of production as will wake the echoes of the old Laurentian hills, and imagination would not be far astray in picturing at our Chaudière water-power large manufacturing establishments for grinding, treating and manipulating this necessary adjunct to wheat growth, long after the present lumber business is removed to points nearer its supply."

Government Aid to Mining.

Halifax, 20th Nov., 1889.

The Editor:

In countries where a royalty, duty or other tax is imposed by the Government upon the precious metals mined therein, it is usual to find governmental aid to such mining industries in some form or other. This aid is always in the direction of keeping alive, fostering, and building up such industries, not only on account of the intrinsic value of the production, but chiefly on account of their value in building up the country, and in increasing the aggregate of the national wealth. In Canada the chief mining province, Nova Scotia, is burdened in the matter of royalties, but, strange to say, has not recompense in the way of government aid. The contrast in this matter between the Governments of Victoria, New South Wales, New Zealand (and in fact all the Australian colonies) and that of Nova Scotia, is most striking.

For many years now it has been a well defined and well executed policy of the Australian Government to foster and stimulate the mining industries of the colonies by the granting of subsidies to deep mining; by the construction and maintenance of good roads to the various mining districts; by the building of water ways, sluices and tramroads, from which by tolls and rents an equitable rate of interest on the investment is secured; by the construction of test metallurgical establishments where lots up to ten tons in weight may be tested and the best metallurgical method of reduction secured under competent advice; by the establishment of "National Schools of Mines;" by the inauguration of a kind of peripatetic school, in which competent men travel from one mining district to another, to instruct, during six or eight weeks in each district, such workmen as desire, in the studies of assaying, mineralogy, geology and mining; and by sundry and various other ways give knowledge, aid and encouragement to that industry to which is due, more than to any other, the national prosperity and wealth. For these and kindred objects

over \$400,000 are annually spent by the colony of Victoria alone.

With natural mineral resources full as varied, and less only in degree, certainly not in kind, Nova Scotia presents the contrast of masterly inactivity, and miserly parsimony. Here, apparently all the energies of the Department of Mines are spent in eagerly taking in the rents and royalties which are yearly and constantly growing in amount. With the exception of the rule or order giving aid to gold district roads (by granting from the Provincial Treasury two dollars for every one dollar paid by the district), and the recent Act relating to "Schools of Instruction for Miners," absolutely nothing has been done to encourage and help the industry from which the Province draws its principal item of income. The Miners' School Act, moreover, is only tentative, and is limited and free only to such of the coal miners as desire to go up for examination as overmen or underground managers.

As the Department is at present organized, the only officer who is in a position to ascertain the needs, and to promulgate and carry forward any scheme for aid is the Inspector, who, by law (Chap. 7, Sec. 5, R.S., Nova Scotia), is supposed to be a professional mining engineer, and is required to see that mines under lease from the Crown "are being worked in a scientific, workmanlike and effective manner." The gentleman now holding the office of Inspector has the requisite qualifications and ability, but, unfortunately for the mining industry, the Government in a spasmodic attempt at economy, some two or three years ago, united the offices of Deputy Commissioner and one person is now supposed to perform the duties of the dual office. However able and conscientious the incumbent may be, it is simply impossible that any one man should perform the respective duties of Deputy and Inspector and do justice to both; the duties of the two offices are largely of a different character, and call for a different order of ability in administration.

Were the Inspector freed from the petty details and time exacting duties of the Deputy Commissionership, it would afford time and opportunity for the doing of much good and the giving of much help in a judicious and authoritative way; e.g. by condemning obsolete and extravagant devices and methods; by discouraging the expenditure of large sums upon improved properties; by encouraging and promulgating sound principles and systems of mining, and known and tested methods of milling and reduction; and in general, by frequent visits to the mining camps to unite the confidence and consultation of the men in charge of the mining industries. And in this connection it may be said that advice coming in such a way, from an authoritative source, is always well pondered over and considered, if not followed: but the practice which seemed to obtain last year, of sending to certain gold districts, an irresponsible

person, having no knowledge of the mining business, either by training or by practice, and who has not the confidence of the mining managers, but whom on the contrary they know to be a novice, should be condemned. Mining men are very receptive of ideas, and, as a rule, eager to learn: but they are very quick to detect incompetency, and to reject what they believe to be unreliable.

Among the few good ideas which have been advocated as government measures, none are so promising as the Assay Office scheme which was elaborated by the Gold Miner's Association of Nova Scotia, last winter. This was a first step and a most important one toward the beginning of a new era in the gold mining industry. Where else in the world can be found a country producing precious metals to the extent of Nova Scotia with not a single assay office in the Province? It will seem incredible to other gold producing countries. We sincerely hope that the Assay Office scheme will not be allowed to drop, but will be taken up again at the coming sessions of both the Dominion and Provincial assemblies.

The idea of the government subsidizing deep mining is also excellent, but is surrounded with many pit-falls, and will need great care in working out. Any aid of this nature must be applicable to any and all of the different gold mining districts of the Province, and it is worth considering whether the aid afforded by the government should not rather be of the nature of a bonus, say a bonus of a fixed sum for each shaft attaining a depth of 1000 feet, of another fixed sum for each shaft attaining a depth of 1500 feet, and for another fixed sum for 2000 feet or over. Another consideration may be whether a rebate of royalties, in a fixed ratio for the depths attained, would not be wider reaching in its benefits.

It is certainly time that Nova Scotia was aroused to a sense of its shortcomings in this matter, and that the mining industries of that Province should receive the encouragement and aid to which they are justly entitled.

I am, etc,
GOLD MINER.

Phosphate Analyses.

Montreal, Nov. 17, 1889.

The Editor:

SIR,—Some comment having been made upon my remarks, at the Meeting of the American Institute of Mining Engineers, at Ottawa, with reference to the system of selling Canadian phosphate abroad, I ask your kind permission to give some further facts bearing upon this subject, which is one of vital importance to the Canadian phosphate industry.

The encouragement of mining of course depends upon its financial results, and no work will be long carried on unless it is profitable. The nominal prices for phosphate in Europe have tempted many persons to undertake its

production, but the returns have been so much less than was expected that the effort, after one attempt, has in many cases been abandoned, and a number of properties that are capable of profitable working have been consigned to idleness.

The first disappointment in the account sales was the discovery that a discount of $2\frac{1}{2}$ per cent. was taken off the nominal price. Next it was observed that the weight of the phosphate as ascertained upon discharge from the ship, was reduced by a deduction of the moisture expelled by drying a sample of the ore at a temperature of 212° . This deduction often amounted to three or four per cent., and in many cases was taken, not from the weight, but from the percentage of phosphate of lime, thus occasioning a further loss of 2 or 3 per cent. a ton. Then the quality was found to be much lower than it had been estimated by Canadian analysts. The chemists had differed over three per cent., so a third one was called in who agreed with the lowest, and the average of all the tests brought the result perhaps one per cent. below the guaranteed quality. The phosphate having been delivered to the buyer, the seller was now completely at his mercy, and instead of a settlement at the usual market rate of one fifth of a penny a unit, the buyer gave the alternative of taking the phosphate away or accepting a reduction greatly in excess of the usual sliding scale. The net proceeds failed to cover the cost of production, and mining was discontinued.

Many of your readers in Ottawa County will say, "that was just my experience!" In fact, Mr. Editor, "we have all been there," and some of us have been there so often that we are at last determined to do something about it, and if possible put a stop to what is nothing less than a commercial scandal.

In addition to the objectionable system of guarantees and the absurd practice of delivering goods to the buyer before their value is determined, there is ground for suspicion that in some cases the sampling is not fairly done, and that the remark of an agent, "a five pound note will go a long way," is not wholly unwarranted. The fact also remains that the analysis of the buyer's chemist is in a majority of cases lower than that of the seller's chemist, and, as I have stated, was so in one season's shipments in seven cases out of eight, and the differences have been sometimes as high as $3\frac{1}{2}$ per cent.

A few experiences that can be verified, if called in question, will show what has been suffered by Canadian sellers of phosphate in Europe. A cargo was forwarded by rail to Oldham, near Birmingham. It was sold at 1s 2d for 75 per cent., with $\frac{1}{2}$ d. per unit rise. Careful sampling and analysis in Canada made it 75 per cent. The result of the English sampling and analysis was 72 per cent. The trade reduction would have been $\frac{3}{4}$ of a penny, making the price 1s $1\frac{3}{4}$ d per unit, or 80s 5d per ton. But the market having fallen, and the cost of removal being heavy, the buyers succeeded in forcing a settlement at 10 $\frac{1}{2}$ d per unit, or 63s per ton, taking an advantage of 17s 5d per ton beyond the usual allowance.

A cargo guaranteed 70 per cent., and analyzed over that in Canada, was transhipped to an outport from London. The seller's chemist made it 71, the buyer's made it 68, the referee made it 67. The lot was rejected, and rather than let the buyer have it at slaughter prices it was taken back to London and shipped to the Continent, the expenses entailing a heavy loss.

A cargo shipped to Stockholm went two per cent. below guarantee. Exorbitant demands being made, it was taken to Hamburg, and

freight and expenses nearly ate up the whole venture.

In one case this season where a cargo went only two per cent. below guarantee, a demand for a reduction of £1 10s per ton was made, though the trade allowance would have been 13s per ton. In another case, rather than yield to an exorbitant demand, where there was a falling short of only two per cent., the lot was taken away at a loss of £1 per ton to the seller.

Cases could be multiplied far beyond the limits of your space and the patience of your readers. These are enough to show the grievance; and now let us consider the remedy.

Methods of sampling that admit of no partiality must be insisted on. The chemists must be urged to adopt uniform methods of analysis. Sellers must resist the demand for deducting the moisture from the percentage of quality. Above all, the sale upon absolute guarantee must be refused, and the sliding scale of price must work equally up or down, or at most $\frac{1}{2}$ d up and $\frac{1}{4}$ d down. But it will be said that buyers must have some assurance as to what quality they are to receive. To meet this reasonable requirement a sample should be taken and an analysis made before shipment by some person recognized as an authority by the buyers and sellers, and this should determine the classification for shipping purposes, no further guarantee being given; but the settlement of value would be made as now upon the foreign sampling and analysis. The sampling should be done by one impartial person instead of making it a contest of wits between two parties, each bent upon taking advantage of the other.

Efforts have been made by sellers in the past to secure these concessions, but the volume of Canadian export has been too small, and there has been too little harmony among producers to permit the dictation of selling terms. Now that Canadian phosphate has won its way in the market, and the raisers, it is to be hoped, have learned the lesson of union and friendly combination that is being exemplified in all successful industries, the time has come to put an end to the remediable ills from which the phosphate trade has so long suffered with a patience that is not to its credit.

The first thing to be done is to refuse to sell on absolute guarantees of high quality with privilege of rejection. The Carolina phosphate is quite uniform in quality, and there is but little risk in a guarantee of 55 per cent. Put although the pure Canadian apatite always contains from 85 to 92 per cent. of phosphate of lime, the quality of a shipment depends upon the amount of other rock that has been allowed to mix with the apatite. This it is very difficult to determine, and the sampling of Canadian phosphate must be always something of a lottery until it is sold in a pulverized condition. It is this very uncertainty that has made the buyers strenuous for high guarantees, for they have learned that there is a chance that a good lot will go under test and may be rejected and brought in at a great reduction.

The remedy, then, for the chief evil of the trade, the rejection of goods after they are in the buyer's hands, is this—the united resolution of sellers to sell on the statement of quality by a recognized authority, but without guarantee. Union and conference will also determine means of obviating other disadvantages. Phosphate is constantly assuming increased importance as an article of commerce, and the future of its producers is a bright one if they will use their intelligence to secure fair play.

ROBERT C. ADAMS.

Possibilities of Iron Manufacture At Ottawa.

By John Birkinbine, Philadelphia, Pa.

The unsatisfactory results which have followed some of the attempts to produce and manufacture iron in the Dominion of Canada, and the failure of capitalists to take advantage of the bonus offered by Parliament, have combined to encourage a degree of distrust in Canadian ventures which seems scarcely warranted by existing conditions.

In a paper presented by Mr. J. H. Bartlett, of Montreal, at the Halifax meeting of the American Institute of Mining Engineers, the various attempts to manufacture iron in Canada were reviewed, and the possibility of achieving success strongly presented. Mr. Bartlett justly claims that much of the discredit which has come upon investments in the production or manufacture of iron in the Dominion is due to the facility with which money was placed in so-called "improved processes," heralded as short cuts to metallurgical success. He also asserts that "the only attempt ever made to manufacture coke pig-iron and refined bar-iron has proved the possibility of so doing."

The small output of Canadian pig iron, which has been mostly produced from bog-ores with charcoal as fuel, does not give promise of extension, for although these ores are abundant, they are lean and hydrated, requiring the mining of large quantities of ore and the rapid denudation of convenient timber on account of the consumption of ore and charcoal per ton of product. The future of the Canadian iron industry would appear to be dependent upon the magnetic and red hematite ores more than upon the leaner bog-ores, although the latter may form an important factor in mixtures. The abundance of timber promises a supply of charcoal for an industry of considerable dimensions, but wood is constantly appreciating in value for other purposes, and although there is a large field for the manufacture of iron with charcoal, the bulk of the iron produced will most probably be smelted with mineral fuel. Coal is found in the eastern provinces and also in the western section of the Dominion, there is no apparent supply of domestic mineral fuel within 700 miles of Ottawa.

A critical examination of a number of iron-ore deposits convenient to Ottawa, encouraged the presentation of a discussion upon the possibilities for producing pig-iron offered by the Capital or its vicinity, as a basis for determining the practicabilities offered by the Dominion for iron production and manufacture. At the outset it may be noted that within six miles of the parliament buildings, portions of a blast-furnace are now standing, the plant having been constructed to smelt the local magnetites with charcoal, and within eleven miles there are the ruins of a forge and charcoal kilns, part of a plant where blooms were produced from ore by the direct or Catalan process, neither of these have been active in late years.

In the production of iron the first desideratum is the ore supply, and omitting further notice of the bog ore deposits in Quebec or the large exploitations which have attracted attention and capital in the vicinity of Hastings, Ontario; attention will be directed to some deposits which are more directly tributary to Ottawa and from which various mixtures could be made. Some of these were mentioned in a paper by Mr. Fred. P. Dewey,* Curator of the National Museum, at Washington, and all of

them are referred to in Prof. Harrington's monograph, upon the economic minerals of the Dominion of Canada.

These ore-deposits which have been personally examined are:

A. In the Province of Quebec at Hull, six miles, and at the Haycock Location, eleven miles north of Ottawa. As Hull mining has been prosecuted to a considerable extent and large quantities of ore removed, some of which was smelted in the blast-furnace above referred to prior to its partial destruction by fire, but most of it was shipped to the United States prior to the assessment of the customs duty of 75 cents per ton. This ore was carried by rail to the St. Lawrence River on Lake Ontario for 50 cents per ton, and from the Canadian ports to Cleveland the freight was 75 cents per ton. A royalty of \$1 per ton was also paid to the owners.

At the Haycock location and at adjacent properties the exposure is such as to offer impressive surface indications, but although some of the mineral was worked into blooms in the forge mentioned, the operations were not sufficiently extensive to develop the properties or to prove their commercial value. This ore is mostly specular; and may develop into an important deposit.

The following analyses were taken from the Canadian Geological Survey:

	Haycock.		Hull Red Ore.	Black Ore.
	1	2	3	4
Ferric oxide.....	88.08	85.45	66.20	73.90

1 and 2 by Prof. E. J. Chapman.

3 and 4 by Dr. J. S. Hunt.

B. The Bristol mines in Pontiac County, Province of Quebec, are connected by railroad with Ottawa, 35 miles distant, and present very favorable evidences of a deposit of magnitude from which over 10,000 tons of ore have been won. Some 4,000 tons of this ore were shipped to and smelted in the Charlotte furnace in New York. The ore is a rich, dense magnetite, unusually low in phosphorus, but carrying sulphur in such quantity as to require roasting, for which the property is admirably equipped. There are now in place two Taylor Langdon roasters, and one Westman kiln, modified by Mr. Ernest Sjosdelt, resembling in many points what is known as the Davis Kolby kiln. These kilns are operated by gas generated in Langdon producers. The mine has been opened to a depth of 150 feet, with drifts along the strike of 150 feet and across the vein of 50 feet in one place and 30 feet and 60 feet in length in another locality, while test-pits and magnetic surveys indicate a deposit of considerable magnitude. The following analyses show the composition of this ore, both raw and calcined:

	RAW.			
	A.	B.	C.

Phosphorus.....	.004		0.014	
Silica.....				
Lime.....				

A. Geological Survey of Canada.

B. R. Richards, Boston.

C. Pooth, Garrett & Blair.

D. Lackawanna Iron and Coal Co.

E. McGill, Ottawa.

F. G. Troy Iron and Steel Co.

The latest experiments with the roasters show, according to Mr. McGill's analyses, that the sulphur was reduced to 0.279.

C. In Lanark and Renfrew counties, Ontario 30 miles west of Ottawa, there are some favorable exposures of hematite and magnetic ores, samples taken from exploration shafts or outcrops analyzed as follows:

	Magnetite.	Hematite.
Iron.....	65.31	66.00
Phosphorus.....	0.017	0.06

The location of these ores, while convenient to Ottawa, is such as to facilitate their smelting with charcoal, for they occur in a well-timbered district, in which hard woods predominate.

D. Still further west in Ontario, on the line of the Kingston and Pembroke Railroad, are deposits of magnetite, which have been wrought considerably; such as those at Calabogie Lake and at Wilbur mine. The latter was operated by the Bethlehem Iron Company of Pennsylvania, and considerable ore was shipped to the furnaces of that company at Bethlehem. These ores could also be made accessible to a smelting plant at Ottawa, and lately considerable exploring work has been done in the vicinity of these operations by parties from the United States.

Analyses of some of these ores are presented by Mr. Dewey in the paper above referred to; they show from 57 to 65 per cent. of iron, with phosphorus generally below the Bessemer limit, and none of the determinations give over 4 per cent. of sulphur. Titanium, when present at all, is, according to the analyses, not over 1 per cent.

There are some hematite ores in the vicinity of Ottawa, but most of the development has been in the deposits of magnetite, and those nearest the city are generally sulphurous; a characteristic which should not necessarily condemn them, in view of the facts that over 1,000,000 tons of sulphurous magnetites are annually smelted in the United States, and that some of the American furnaces which have been most successful financially have used entirely or largely such ores.

Blast-furnace practice has demonstrated that it is difficult to produce good foundry grades of pig-iron with dense magnetites, particularly if they carry considerable sulphur; but modern plants, improved method and chemical research have done much to remove these troubles, and it is not prophesy to state that with a well-equipped and properly managed plant, using thoroughly roasted magnetites instead of ore partially calcined, satisfactory work in this particular can be obtained.* *

There seems, therefore, ample ground for relying upon the possibility of assembling a satisfactory supply of ores at or near Ottawa for the maintenance of a smelting-plant.

The limestone which abounds in the vicinity of Ottawa, and which forms the barrier through which the Ottawa River breaks in creating the Chaudiere Falls, furnishes ample flux. This stone is largely magnesian, but officers of the Geological Survey state that it can be obtained

* Vide Transactions, American Institute Mining Engineers, Vol. XII., page 192.

as nearly pure carbonate of lime or with varying proportions of lime or magnesia, and the flux can therefore be readily supplied.

The key to the problem would appear to be that of fuel. The Canadian customs protect its domestic bituminous mines by imposing a duty of 60 cents per ton on bituminous coal or coke made from it, but anthracite coal is admitted free of duty. Notwithstanding the tariff levied on foreign bituminous coal, the supply for the Province of Ontario comes principally from the United States. Last year over 2,000,000 tons of anthracite coal from Pennsylvania were consumed in the Dominion, and in addition 1,250,000 of bituminous coal from the United States paid a duty of 60 cents per ton.

The consumption of anthracite is not surprising when we remember that Scranton, the centre of the Lackawanna coal district of Pennsylvania is no farther from Ottawa, in a direct line, than it is from Rouse's Point, N.Y.; Portsmouth, N.H., or Cleveland, Ohio.

Independently of the customs duty, Ottawa is as favorably located for obtaining a supply of Connellsville coke, as the blast-furnaces on Lake Champlain, or those at Chicago; and under favorable railroad rates the cost of coke furnished in large quantities from the Connellsville district at Ottawa should be practically the cost at Chicago plus the duty of 60 cents per ton. The distances from Ottawa to Connellsville, Pa., and to the boundary of the Province of New Brunswick, are practically equal.

If, however, coke made from coal obtained in some of the northern counties of Pennsylvania is brought to Ottawa, there would be a difference in distance of about 100 miles in favor of Ottawa, as compared with Chicago, to offset the duty.

Whether a supply of coke would come from the Connellsville district, or from some of the more northern Pennsylvania plants which now produce very satisfactory coke for iron smelting, or whether it would be brought from the eastern provinces of the Dominion, would be determined by a full consideration of the subject from a commercial basis when contracts were to be let; but to place the problem on a perfectly equitable footing, we may take the price of coke at Connellsville at \$1.50 per ton; add transportation equivalent to the freight from Connellsville to Chicago, \$2.75 per ton, add for duty 60 cents per ton, making a total of \$4.85 per ton. Allow for less favorable freight rates to Ottawa than given to Chicago, we may add 25 cents per ton; making coke at Ottawa cost \$5.10. Therefore, if Connellsville coke costs this amount at Ottawa, a comparison can be made with the cost of that produced in the eastern provinces, or obtained from points in Pennsylvania 100 miles nearer Ottawa than Connellsville.

Anthracite coal can now be delivered at the furnaces on Lake Champlain for \$4.25 per gross ton, and an allowance of \$5.00 per ton at Ottawa would therefore appear to be sufficient. Whether a mixture of anthracite coal and coke would be most advantageous, or what that mixture would be, can only be decided upon actual contract quotations; but from the above figures an allowance of \$6.50 for the fuel to produce a ton of pig-iron at Ottawa would appear to be conservative.

To obtain an estimate of the cost of material used in the production of the metal, we may assume that the ore from the Bristol mines is used, as the development of this property, its roasting equipment and the indications of a large deposit existing, offer the most satisfactory conditions for immediate utilization, while its

distance from Ottawa (35 miles) is such as will embrace other ore deposits, which have been referred to, some of which will not require roasting to eliminate sulphur, and others may be used as mixtures. To allow liberally, the cost may be taken of the

	Per ton.
Raw ore at the mines at.....	\$1.40
Add roasting and loss60
Freight to Ottawa.....	.55

Cost of 1 ton of ore..... \$2.55

As this roasted ore will yield 60 per cent. of iron, or more, the cost of ore for a ton of pig-iron will be: $1\frac{2}{3}$ tons at \$2.55 equals \$4.25. The convenience of fluxing material will make this item small, and an allowance of 50 cents per ton of iron made should be ample. The materials for producing a ton of pig-iron may therefore be summarized as:

Fuel.....	\$6.50
Ore.....	4.25
Flux.....	.50
	\$11.25

Making a ton of pig-iron cost..... \$14.00

A figure possibly above what practical operation may demonstrate as the actual outlay, but still sufficiently low to encourage operations which will displace at least a part of the 50,000 tons of pig-iron annually imported into the Dominion, or furnish material which may be utilized to produce a portion of the 250,000 tons of manufactured cast- and wrought-iron which enter Canada each year.

That a possible market for the product of a number of furnaces exists in the Dominion needs no exemplification to those who are at all familiar with its territory and its people. But the question naturally arises, can pig-iron be produced in the Dominion to compete with foreign metal?

In this estimate the locality for the smelting of the ores is near the vicinity of Ottawa. There may be other points apparently even more favourably situated, and in that case comparative figures can be readily made. Similarly the ore from the Bristol mines is used as a basis for estimating, because of its convenience to Ottawa, its condition for immediate utilization and the known composition of its product. If ores from other localities are preferable, or if they are to be used as mixtures, proper allowances can be made. We may therefore use the figures of estimated cost herein given as a basis for determining what chances Canadian pig-iron has in competition with foreign iron.

The Canadian duty is now \$4.00 per net ton on pig-iron—the estimated cost above is per gross ton. In addition, the government offer a bonus of \$1.00 per net ton on all pig-iron made in Canada from Canadian ores, therefore the domestic metal would be protected, at least until the expiration of the bounty period, to the extent of \$5.00 per net ton, or about \$5.60 per gross ton.

If now, pig-iron made at Ottawa costs \$14.00 per ton, foreign metal would have to be delivered there at \$8.40 per ton to meet this cost. But an allowance for profit must be made; including this, as well as the percentage of loss from bad debts, and also adding liberally for possible discrepancies in the estimate, say \$2.60, the domestic product could meet foreign iron delivered at Ottawa at \$11.00 per ton. As the iron is shipped away from Ottawa freights must be added, but there still seems to be ample margin to encourage the production of domestic pig-iron in Canada.

The estimates offered are for the production of pig-iron, using anthracite coal, coke, or a mixture of these two fuels, but the subject should not be dismissed without considering the possibility of employing charcoal as fuel, and considerable discussion has, from time to time, been had upon the utilization of the enormous waste from the mills at Ottawa, by converting it into charcoal. The slabs and larger refuse could be charred in kilns, but most of the timber now used in the mills is of a character producing charcoal of inferior quality for blast-furnace use. Improvements in manufacture are also utilizing much of the waste for special products, which reduce the chances of a permanent supply for this purpose.

There seems to be more encouragement to convert the saw-mill refuse and saw-dust into gaseous fuel, as in Sweden, and use it for manufacturing iron and other metallurgical purposes. Gas producers for this purpose would have to be equipped with condensers, for the refuse material supplied to the producers would carry 40 per cent. or more of water.

If pig-iron is produced in the vicinity of Ottawa, there would seem to be good encouragement for investigating the economical employment of this waste material, and also the possible utilization of some of the water-power available in the vicinity.

As noted before, the production of charcoal pig iron apparently offers greater advantages at some of the localities where the ores and hardwood timber are contiguous. The charcoal required for smelting a ton of pig iron would probably cost from \$7 to \$8 at Ottawa, from \$1 to \$2 in excess of the cost at the other points indicated. As this charcoal-iron would be used for special purposes, it should command a corresponding price in the market.

Record of a Charcoal Blast Furnace.—

While 85 tons of pig iron in 24 hours has been the greatest outturn of a charcoal furnace yet recorded, the Hinkle blast furnace, at Ashland, Wisconsin, has made as much as 112 tons in the same time. The furnace stack is 60 feet high and 12 feet in diameter at the boshes. Four casts are made daily, and each cast covers considerably more than half the floor of the casting-house. The outturn of the furnace during the month of March, 1889, amounted to 3,004 tons of pig iron. It is thus evident that at least one charcoal furnace, in point of improvement, is keeping pace with the coke furnaces.

The Gaspé Oil Wells.—

Considerable excitement is reported from Gaspé, on the south shore of the Gulf of St. Lawrence, in consequence of the extensive preparations now going on for the development of the oil deposits there. Indications of petroleum were found there eighteen years ago, it is stated, and a company was in process of formation for the purpose of boring, when the men interested in the scheme were attracted to Pennsylvania by the immense yield of oil there reported. Col. James Foley, of Boston, representing a company of American capitalists, has now arrived at Gaspé with extensive machinery and a strong force of engineers, derrick builders, etc., and is hurrying forward preparations for sinking a couple of wells to a depth of 2,500 feet each. The company represented by the Colonel, it is reported, has acquired a large area of the land covering the Gaspé deposits.

PHOSPHATE.

In General.

A strong company, with a capital of \$1,200,000, has been formed to work an extensive deposit of phosphatic marl, containing, it is said, 75 per cent. of phosphate of lime in Florida. The property consists of 13,000 acres along the Withlacoochie River, near Dunellan in Marion and Cibiris Counties.

In round figures Great Britain annually consumes:—phosphates imported 270,000 tons; coprolites (home production) 20,000 tons; bone, animal charcoal, bone ash, imported 50,000; bones, home production say 60,000 tons, in all about 400,000 tons of fertilizing material.

Great Britain, it is estimated, has imported during a period of nine years ending 1887, about 1,030,842 tons of South Carolina phosphates. The demand for these phosphates in the United States increases rapidly from year to year thus reducing their exportation abroad, and English manufacturers are now looking to other sources for their future supplies. In this connection it is very gratifying to find that the extensive areas of Canadian phosphate are now rapidly gaining in favor.

Mons Graudean recently estimated that one year's crop in France represents 298,700 tons of phosphoric acid, of which only 151,200 tons of phosphoric acid were recovered in the stable dung, thus leaving a deficit of 147,000 tons of phosphoric acid, equal to over one million tons of superphosphate, to be made good by other means. The same authority also estimated that the entire number of farm animals in France in 1882, representing a live weight of 6,240,430 tons, had accumulated from their food 193,453 tons of mineral matter, containing 76,820 tons of phosphoric acid. These figures give some idea of the enormous quantities of phosphoric acid required to restore to the soil what is continually being carried away by the crops sold off the farm.

Markets.

Latest advices quote a good market in Britain for Canadian phosphate @ 1 1/2 d. for 80% and 10 1/2 d. for 75%. A prominent exporter has shewn us a letter in which it was stated that contracts for next season are now being made at a still greater advance on current quotations.

Shipments.

A prominent shipper writes: "Owing to the scarcity of freight room, and the London Strike which retained some of our steamships on the other side for six weeks and subsequently blocked the railways with freight so that we could not even obtain cars at Buckingham, a great deal of Canadian phosphate has been left over that should have gone forward this year. We have over 40 carloads here in Montreal which should have gone forward; all our bins at Buckingham are full, while large quantities are lying at East Templeton, Perth and Kingston. All the other miners and shippers are in the same position."

It is estimated that all the phosphate held over until next year will exceed 5,000 tons.

Great Britain is estimated to have imported during the nine years ending 1887 about 1,030,

842 tons of South Carolina phosphates. The home consumption of these phosphates is, however, increasing yearly, and British manufacturers are now looking to other sources for their future supplies. Canadian phosphates, we are glad to say, are steadily gaining in confidence on the other side, and there is every indication at present, that considerable capital will soon be forthcoming for their further development.

Shipments, 1889.

The following is a statement of the shipments of Canadian phosphate from the Port of Montreal, to date:

Du Lievre District.

From returns received, the North Star Mines have been unquestionably the largest producers this year, quite 10,000 tons having gone forward, while a large quantity has been held over until next season. Capt. Williams has from 50 to 60 hands employed, and a steady output is maintained. All the pits looked well. Copeland and Bacon, New York, have lately furnished a new hoisting engine, and we believe other plant will shortly be added.

The shipments from the High Rock Mines will, we believe, be somewhat less than former years. We should judge that a little over 6,000 tons have been shipped to date. A good deal of dead work had to be done early in the season, which will account for the falling off from former years. About 150 men and boys are now employed, and all the pits, particularly the Cap Rock, are showing up well. Like the other mines, the High Rock has been compelled by the scarcity of freight to hold over a large quantity until next year.

Among the new companies lately registered in London is the Dominion Phosphate Company (Limited), registered by Johnson, Budd & Johnson, 24 Austin Friars, E.C., with a capital of £40,000 in £5 shares. The property acquired (Lot 7 Second Range, Portland East) is situated on the left bank of the river, within easy distance of the Little Rapids Landing, and was formerly owned by Angus McMillan. The price paid, we understand, was \$15,000 cash. Mr. Pielsticker, the superintendent, with a good force, is now actively opening up the property, and producing a good output of excellent quality. A little over 200 tons have been raised since operations were begun.

Messrs. Hutchinson and Würzburger, who have been spending the last few weeks in a close and minute inspection of our sources of phosphate supplies in the interests of the Anglo-Continental Guano Co. (formerly Ohlendorffs), have returned to England, thoroughly well pleased with their trip and with their investigations. Before leaving, we understand, they completed, on behalf of their company, the purchase of the property of Mr. A. F. McIntyre, consisting of 200 acres, and located immediately adjacent to the Emerald mines, in the township of Buckingham. The price is not stated, but we have heard \$60,000 mentioned as the amount probably paid. The necessary plant, and an efficient force will at once be set to work the property on an extensive scale. A small gang is now engaged in preliminary working. The appointment of a manager is not yet announced.

There has recently been uncovered on the Aetna Lot (part and parcel of the property acquired by the Anglo-Continental Guano Co.) a monster crystal of green apatite, weighing several tons, and probably the largest in the world. Its dimensions are seven feet long by four feet wide. It is perfectly formed. An endeavour will be made to excavate this enormous crystal in its entirety.

We have nothing to report from the Emerald mines. The shipments are thought to have been below the average of previous years.

Mr. W. A. Allan continues to carry out his plan of the systematic development of his Little Rapids mine. At present the men are employed on several excellent shows, in which, at our last visit, large masses of rich phosphate were exposed.

Recent advices from the district state that all the pits of the Canadian Phosphate Company are doing fairly well. It is estimated that quite 3000 tons of cobbled phosphate have been held over at the mines. As will be seen from a reference to the table of shipments, the quantity exported by the company to Europe was 3540 tons, while a large quantity of lower grade was sent in a ground state to the United States.

Templeton District.

The shipments from the Blackburn mine aggregate about 1,200 tons. This is much less than in former years, and is altogether due to the amount of improvement work done on the property during the season.

Perth District.

At the Bob's Lake Phosphate Mines, the Anglo-Canadian Phosphate Co. continues to secure a large output for the number of men employed. From one pit 53 tons were mined, cobbled and piled in three weeks by 5 men and 2 boys, the hoisting being done by horses. A seam 200 feet in length and four feet wide has been opened in the past month. The surface ore in this vein is mixed with iron, but is likely to improve at a depth.

Mr. Würzburger, a Belgian engineer, has visited the Otty Lake and Bob's Lake Phosphate mines lately in company with Mr. Richardson of Kingston. He has been taking notes of all the principal properties in the country.

Mr. Wm. Davies of Perth is having contract work done on a lot near Otty Lake, belonging to Mr. Morris. Some good seams have been

opened, one of which is said to be seven feet in width. One of the oldest miners paid \$50 for a half interest in the working of it on contract at \$6 per ton.

A surveying party is now locating the route for the extension of the Brockville & Westport Railway to Sharbot Lake. They have located the line across the narrows of Bob's Lake at Kilpatrick's, and through the lots on which the Bob's Lake Phosphate mines are situated. This will give the best possible facilities to the phosphate industry of that region. American capital has been secured and the line will be built next summer.

Kingston District.

We are advised that the old Board of Directors of the Foxton Mining Company has been reinstated, and that the first allotment of shares has been ratified. The mine continues to turn out about 300 tons per month of high grade ore. Since 1st of May to close of navigation some 850 tons have been shipped from the mines.

The value of the phosphates exported from this district to Great Britain and the United States since 1st January to date, is officially stated at \$11,944.

Capt. Boyd Smith has resumed operations at the Blessington mines.

Nova Scotia.

Miscellaneous.

At the Albion Colliery, the further sinking of the "English" slope has been suspended. How long this suspension may last is uncertain. The machinery, so far employed in sinking, is not heavy enough for more extended operations, and the company may not be in a position at present to procure the machinery to the full equipment of another colliery. The work done is satisfactory, and has demonstrated that a large area of good coal in the Cage pit seam is readily procurable. The further the sinking went the better the coal became. The bottom bench contains three feet to three feet six, and the fall two feet of excellent coal, with a thickness of two feet between of harder coal. This stone bench, as it is called, disappears towards the deep, and at a further distance of 100 feet it is believed the seam is of a uniform, superior quality. Before the slope, which has been sunk some 1,700 feet, can be successfully operated, a new hoisting engine is necessary, and also a branch railway connecting with the main line.

The following are the successful candidates for certificates of competency at the recent meeting of the Nova Scotia Examining Board:

UNDERGROUND MANAGER'S CERTIFICATES.—A. McDonald, Cow Bay; John Carey, Sydney Mines; D. H. Ferguson, Victoria; Isaac Greenwell, Victoria; S. F. Lee, Victoria; Bart Connors, Victoria; G. W. Greenwell, Victoria; E. McPhee, Victoria; A. Ferguson, Victoria; H. McKinnon, Stellarton; A. D. McKenzie, Stellarton; H. McCarter, Stellarton; A. McDonald, Stellarton; W. Lorimer, Maccan; T.

Blackwood, Maccan; C. Hargreaves, Spring Hill. **OVERMEN'S CERTIFICATES.**—Murd. Morrison, Cow Bay; R. B. Crosby, Cow Bay; Chas. Young, Sydney Mines; Ed. Lockman, Sydney Mines; M. Sullivan, Sydney Mines; John Dorsay, Sydney Mines; David Brown, Sydney Mines; Thos. Johnstone, Bridgeport; John Caddigan, Bridgeport; Alex. Cameron, Victoria; D. Ferguson, Victoria; A. McAskill, Victoria; M. H. Nicholson, Stellarton; A. Babine, Maccan; Charles Rennie, Springhill; Arch'd. Ferguson, Spring Hill; W. Matthews, Spring Hill; George Yarrow, Spring Hill; Alex. B. Wilson, Spring Hill.

Rockingham.

There has been a newspaper excitement for some time past over the discovery of lodes near the "Prince's Lodge," supposed to be gold bearing, but a close examination of the lodes as yet stripped fails to discover any gold in them. Rumor has it that a mill is to be built there at once; it is to be hoped that such is not the case, for very much development work is needed upon the lodes already found before there can be the least foundation for such an expenditure of money.

Ardoise Hill.

The property of the St. John, N. B., Company, formerly operating here, was sold by the Sheriff on Thursday, October 10th. It is understood that the property was bought in for the shareholders, and that the old company will be re-organized.

Central Rawdon.

Manager Willis has ordered from I. Matheson & Co., New Glasgow, two new boilers for the Northup Mine, each is 4½ by 14 feet, and is nominally 60 horsepower. New pumping and winding gear will be added shortly.

North Brookfield.

The new mill of the Philadelphia Gold Mining Co. is nearly completed, and will be turned over to the company by the contractor before the end of October. The mill has 20 stamps.

Fifteen Mile Stream.

The Egerton Company has encountered a richer streak of ore towards the eastern end of their workings. Returns for September show 131 ozs. from 183 tons crushed.

Killag District.

Late advices from this district show that the lode referred to in September issue has been cut. Owing to the protracted drought of this summer the large swamp was dried to a greater extent than was ever known before, and Mr. Stuart put some men at work sixty feet north of his main shaft in line with his rock crosscut. To his surprise but six feet of surface were encountered, and the shaft came down nearly upon the lode. The lode thus exposed is about 10 inches wide, and judged worth \$30 per ton. The steam hoisting and pumping gear is being moved to the shaft on the new lode, and work will continue all winter.

New Brunswick.

The Markhamville mines are now owned and operated by The Pope Manganese Company, of 62 Franklin street, Boston. W. C. Pope, Esq., is general manager, and Major Markham is the manager at the mines, as he has been for upwards of 23 years. The new company have added to their plant a Diamond drill from the Bullock Manufacturing Co., of Chicago, for prospecting purposes, and a cyclone mill from the Canada Pulverizing Company, of Montreal, for grinding Manganese; both machines have been in operation some weeks. About fifty

lands are constantly employed in and about the mines and mills. High class manganese milled and prepared for consumers is being constantly shipped to headquarters in Boston for distribution to customers all over the United States and Canada, and several cargoes of blast-furnace ore have been shipped to steel furnaces in Pennsylvania during the summer.

While very little work has been done at the Stockton mine, during the summer, a number of speculators and so-called experts have visited the property, and it is reported that offers have been made for its purchase, but the owners still have a fancy price on it.

The Quac mine is being operated again by a Boston company, and one shipment of about 40 tons of blast-furnace ore has been made to the United States. Mr. Morrison is the foreman at the mines. He reports about 150 tons now ready for shipment to Carnegie Bros., Bessemer, Pa.

Application for incorporation is made by the Welsford Red Granite Co., for the purpose of quarrying red granite at Welsford, Queen's Co. The capital is \$50,000 in 1,000 shares, and \$10,000 has already been subscribed. The following are the first directors of the new concern: B. Sancton, banker, New York; A. J. Trueman, barrister, St. John, N. B.; J. A. Chesley, manufacturer, St. John; R. Wisely, St. John; John O'Connor, St. John, N. B.

Mining matters here are comparatively quiet at present, but there is a possibility of considerable capital being expended in the near future. The manganese deposits of New Brunswick attract considerable attention. The chief deposits are in King's County, near Sussex, where are located the well known Markhamville mines, which have been worked continuously for thirty years or more, and show no signs of exhaustion. This property is managed by Major A. Markham, of Markhamville, and affords employment to a large number of employees. The ore is exported to Nova Scotia and Great Britain.

Two other manganese mines are in this locality—one, known as the Jordon Mountain mine, on which exists a large body of ore suitable for steel purposes. It is rumored at the present time that American capitalists are negotiating for the purchase of this property. This mine is about six miles from Sussex station, on the Intercolonial Railway.

In the Dutch Valley district, in same direction as the Markhamville mines, is a property known as the "Glebe," owned by Bar Harbour and local parties. It has had considerable development and bids fair to be a productive property. The ore is of a high grade and very pure indeed.

Manganese is also reported in the vicinity of Golden Mountain, in Albert County, in paying quantities. Near Hopewell or Hillsboro, in Albert County, are deposits of manganese, and it is said a property of wad or bog manganese has recently been sold to American capitalists. Manganese is also reported to occur in the northern part of New Brunswick, but enough work has not been done to establish the paying capabilities of the same.

Near Bathurst, in Gloucester Co., a valuable vein of magnetic iron ore has been recently disposed of to New York parties at a fair price,

and work of development is now in course of progress. The ore belt is fully 30 to 40 ft. in width, and assays have shown fully 66 per cent. metallic iron with great freedom from silver, phosphorous, etc. Running parallel with the ore vein is a load of yellow sulphate of copper fully 6 ft. in width, giving about 13 per cent. copper. This bids fair to be a very valuable property.

Lead and silver ore in good paying quantities exist in Gloucester Co., on the Mackadoo and Elm Tree rivers, and would repay the expenditure of capital. Specimens of galena from the Elm Tree mine have assayed as high as \$300 per ton, and in some instances associated with it as high as 22 dwts. of gold.

Recently a galena vein of good paying character has been discovered at Jacksonville, a few miles from Woodstock, and work of exploration is being vigorously carried on. A shaft has been sunk 50 ft. up to present date, and prospects look exceedingly bright.

Lead and silver or galena ores occur at several other points in New Brunswick. On the Hammond River, in Kings County; at Musquass, in St. Johns County, and in several other localities, very little has been done to develop them.

The iron deposits of Woodstock which were worked some years ago are extensive, and in these days of scientific treatment, iron ores should be profitably worked by capitalists.

The gypsum or plaster mines of Hillsboro are being vigorously worked, and with the completion of the Tobique railway now under contract, the immense plaster deposits of this locality will no doubt be extensively worked. Plaster deposits also occur in paying quantities in lower portion of Kings County, in the vicinity of Upham.

In St. George and along this peninsula large deposits of yellow sulphuret of copper exist, and beyond doubt could be profitably worked. Along the Bay of Fundy shore, near Point Wolfe, other ores exist in paying quantities.

In King's County, brine springs are quite numerous, and at or near Penobsquis small works are in operation. The salt manufactured here is beyond doubt superior to any in Canada, and with the application of capital to run them on a large scale, could beyond doubt be made to pay handsomely.

Finally, in this somewhat rambling description, it may be safe to say that those who have given the subject considerable thought have a firm and abiding faith that gold will be found yet in paying quantities. Geological reports on the Province show gold at several points, and it is currently said it exists beyond doubt on the Tobique. Gold has been found in the drift or sand in some of the streams of Albert County, and evidences of it have also been found in the St. George District. No regular or systematic search has been made for it, but the time is not far distant when it will be, and with a modification of our mining laws, which are somewhat crude, and which it is proposed to amend this coming session of the Local Legislature, we may hope for a vigorous research for this much coveted article.

It is reported that the somewhat singular deposit of bog manure in Albert County has been sold to New York people.

Mr. Fenwick Fraser, of Rothesay, and others, are doing some prospecting in Albert County, on a lead of galena and silver, a shaft has been sunk upwards of 50 ft. with very encouraging results.

Mr. James Martin, of St. Martins, and Mr. N. Shaw, of St. John, have made some trial pits on a lead of silver and galena at Musquash, in St. John County, with like cheerful prospects.

Quebec.

Notwithstanding the unfavorable weather, operations are going on briskly at all the mines, and large shipments of asbestos continue to be made.

Mr. William King has had the debris from the recent land slide cleared out of his main pit and mining is now being conducted on some excellent veins. The explorations on Lot 28, 5th Range, Thetford, and on the property in the Township of Ireland have proved eminently successful. These reserves give promise of excellent returns.

Shipping from the Bell's Company pits continues to be brisk. We observe that the shares of company put on the market last year at £5 are now quoted at £20.

Great activity is also noticeable at the pits of the American Asbestos Co., the Johnston-Irvine Co., and other concerns.

The United Asbestos Company (Ltd.), London, Eng., has recently acquired the interests of the Frechette Mining Company, at Black Lake, Megantic County. The property consists of 75 acres fairly developed, and the price paid was \$70,000. This concern has hitherto been one of the largest users of Italian asbestos. Mr. John J. Penhale, formerly of the Scottish Canadian Company, has been engaged as mining superintendent. Orders have been given for a complete plant, and as soon as this is in place, operations will be carried on in a large scale.

The production of Canadian asbestos for the fiscal year ended 30th June last, is estimated to have been close upon 5,000 tons.

A fair output of copper is maintained at the Harvey-Hill mines. The smelter gives satisfaction.

The British North American Mining Co. has issued a call of thirty cents per share to meet municipal taxes.

Dr. Jas. Reed, will, we understand, commence work shortly on his property, Lots 27, 28 and 29, Range A, Coleraine. A plant similar to that in use at the American Asbestos Co., will be used.

Messrs. Thompson & Sheridan, of Toronto, have purchased 300 acres of land lying in St. Sophie parish, Que., in which it is said, are large and valuable deposits of marble, equal to the finest found in Italy.

The Plumbago mines and mills near Buckingham are now working full time. Shipments to the States give great satisfaction.

Messrs G. H. Nicholls & Co. of New York, have commenced operations at their New Smelting Works at Capelton. The demand for this Company's superphosphate is, we are glad to say, steadily increasing.
